YOU CAN MAKE A FORTUNE IN MICROS!

THE MICRO COMPUTER BUSINESS WILL GROW FROM $10 TO $100 BILLION IN THE NEXT EIGHT YEARS! ARE YOU READY TO CASH IN?

The **micro computer business** is predicted to grow from its present $10 billion to **$100 billion** before 1990! Imagine the possibilities this opens for you! No matter where you live, if you're starting up or presently in business, **no other industry offers you more opportunities!**

Now, finally, all the inside information you need to secure a prosperous future in this dynamic industry is available in **one place - THE COMPUTER ENTREPRENEUR MANUAL!** – An **immense** information source, compiled by our **inquisitive** research team, aided by a panel of **experts** and **business people** from **all areas** of the **computer industry!**

We present the inside story of **more than 100 lucrative computer businesses you can enter,** where you'll find the **real opportunities** for the eighties: from one man operations like **Programming Author, Word Processing Center** or **Consulting,** to **Systems House, Service Bureau, Computer Store etc!** Many at little or no investment! All the invaluable facts and figures: **How to start, Capital needs, Profit estimates and Margins, How to Sell and Market, How missing** technical or business experience **need not stand in your way, Source of Suppliers, etc!** Details that could take **years** to find out on your own!

We'll show you **inside tricks,** like how to **never again pay retail** for computer products and consumer electronics, **even for one item - right now,** while you're starting your business! How to get **free merchandise** and trade show **invitations, etc. This alone** will **more than pay** for the **manual!** You'll read **actual case histories** of other computer entrepreneurs, so you can **learn** from **their mistakes,** and **profit** from their **success stories! Where** you'll be **one year** from now depends on **your actions today!** Let us **show you how** to take the **first crucial steps!**

Order now and take **advantage** of our **limited introduction special, THE COMPUTER ENTREPRENEUR MANUAL,** and a **six month subscription to THE COMPUTER ENTREPRENEUR REPORT/NEWSLETTER** (so you're **always up-to-date** with the industry), **both** for **only $29.95! You must** be **convinced** on **how easy** you can **strike it rich** in the micro computer business - or you may **return** the manual for **a full refund** within thirty days! **USE OUR TOLL FREE NUMBER TO ORDER!**

EVERYTHING YOU NEED TO KNOW TO SUCCEED IN THE COMPUTER BUSINESS IS ALL IN THIS MANUAL!

THE COMPUTER ENTREPRENEUR MANUAL has the **answers** to **all your questions** about **selecting, starting** and **succesfully running a computer business!** There has **never** been such a **comprehensive collection** of **know-how** and **information** about this business **in one place! All the facts you need** to **plan** and **acheive your goals** in **easy-to-follow, step-by-step instructions!**

These are some of the **100-plus businesses** covered in **PART ONE** of the manual, with the facts on **How to start and run, Start-up Cost (Even** how to operate **on a shoestring**), What **profits to expect, Wholesale prices, Mark-ups, Suppliers, future outlook, case histories** for **each, etc:**

Systems House, Software Author (who to sell to and who to avoid), **Service Bureau, Software Publisher** (How to find programs that sell, **Word Processing Service, Consulting** and **Consultant Broker** (use your skills or those of others, **make $150 - $1000 a day!**), **The incredible Games Business, Computer Store** (Franchises: Pro and Contra, or a low inventory store **in your home!), OEM, Hardware Mfg, Data base** and **Teletext Service (big prospects!), Used Computers, Repairs, Rent-A-Computer, Promote Fests** and **Trade Shows, Turnkey Systems, Bartering, Mail Order, Compile and rent mailing lists, Specialized Data Headhunting** and **Temp Help Service, Tech Writer Shop, Custom Engineering,** The **highly profitable Seminars** and **Training Business , and many more!**

Many **new ideas** and **ground floor opportunities! Interviews** and **success stories** on **companies** of **all sizes! Privy info on the profits made:** How some **computer store** operators **net $100 - $250,000!** Little known outfits that made their owners **millionaires,** one of these low-key companies, making simple boards, went from **nil to $20,000,000** and **100 employees** in **four years!** Programmers that make **$300,000, Thousands** of **micro millionaires** in the making, etc!

Whatever your goal is - **Silicon Valley Tycoon,** or just a **business at home - we guarantee** you'll find a **business** to **suit you - or your money back!**

PART TWO of the manual is **loaded** with the **know-how** and **"streetfighting" savvy** you need, both as a **novice** or business **veteran,** to get started, to stay and to **prosper** in the micro computer business! **A goldmine of information** in clear and easy-to-use instructions: How to prepare your **Business Plan, Outside financing,** The **mistakes** you **must avoid,** How to **hire** and **manage employees, Incorporation** (when, and how to do it **cheaply**), **Surviving bad times, Record Keeping,** how to **estimate your market before you start,** Use **multiple locations** to **maximize profits,** how to **promote** and **stay** steps **ahead of the competition!** How to get **free advertising, free merchandise, free advice, Power negotiating** with suppliers to **double** your **profit margins, etc!** Even how to **keep a present job while starting a business part time!**

Don't miss this opportunity to be part of this **great industry - the next success story** could be **your own! Order the manual today!** Part one and two, bound in **a deluxe ring binder,** where you can also **collect our newsletter (free for six months with the manual - a $32.50 value!) - all for only $29.95!**

THE COMPUTER ENTREPRENEUR NEWSLETTER – ALL THE LATEST INSIDE BUSINESS NEWS! NOW! SIX MONTHS FREE WITH YOUR MANUAL!

You're **always attuned** to the industry, and **your manual kept up-to-date,** with our **newsletter!** Each issue has the **latest business news, ideas, new suppliers,** our **indispensible "watchdog" column** on **profits, discounts** (don't miss mfg's promos, like recently, when top video monitor sold at $80 - that's half wholesale, **one third of the retail price!), the competition, the big deals, etc! Feature stories** with start-up info and case histories **on new micro businesses!**

You'll get **invitations** to trade shows and conventions, the **usage** of our **advisory service** and our **discount buying service** for your purchases!

You'll find **many items** in our newsletter that will **save you the cost of your manual many times over!**

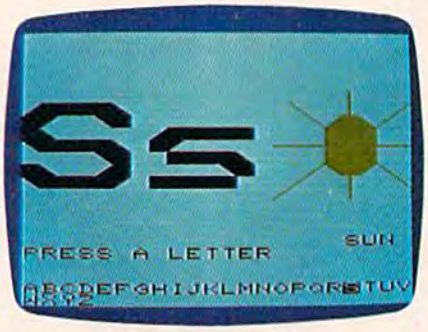
REVIEWS

Children's Educational Games

Tony Roberts, Assistant Managing Editor



ALPHA-BECi *uses simple graphics to teach letters of the alphabet.*

The goal of Boston Educational Computing is to provide owners of the most elementary computer systems with educational software that can be used easily by those with little knowledge of computing.

In its Child Development Series, BECi (pronounced Becky) meets this goal. Among the software in the series are a counting program and an alphabet program aimed at preschool children and an addition-subtraction program targeted for the slightly older child.

All of the programs are on tape and are designed to work on an unexpanded VIC-20, but they perform just as well with a memory expander. *NUMER-BECi* and *ADD/SUB* are also available for the Commodore 64 and Atari computers.

Introducing The Alphabet

ALPHA-BECi is intended to help preschool children learn the letters of the alphabet, both upper- and lowercase, associate each letter with a word beginning with that letter, and see how each letter relates to the others in the alphabet.

For each letter, the program provides a screen which includes the capital letter, the small letter, and a picture of an object. The screen is slowly drawn, giving a child the opportunity to call out the name of the letter or object as soon as he recognizes it.

First, the capital letter is drawn, then the associated small letter, then the object with its name below. The entire alphabet is then printed at the bottom of the screen with the target letter highlighted.

ALPHA-BECi can be run in one of three ways. From a menu you decide whether to run the program sequentially, randomly, or under keyboard control. That is, the program will either step through the alphabet from A to Z, will display random letters, or will show screens for the letters selected by the user. The mode can be changed at any time by pressing RUN/STOP, then rerunning the program.

For a child, watching the colorful objects appear on screen is like opening a present. The program's only sound effect is a boop-boop-boop that comes as the letters of the alphabet are being printed along the bottom of the screen. For an adult, it may become a little annoying, but it seems to be music to a child's ears.

Shapes And Colors

NUMER-BECi teaches the preschooler to identify the numbers from 1 to 12, to identify shapes, and to identify colors. And it is set up so the youngster can learn these new ideas at his own pace.

The menu offers the following options:

1. COUNT LIKE THINGS
2. COUNT UNLIKE THINGS
3. COUNT COLORS
4. COUNT SHAPES
5. COUNT COLORS AND SHAPES

A second menu allows you to select a time limit for the answers. Your options here are to let the program run itself, filling in the answers after a specific time delay; have it wait until the child fills in an answer; or have it set a time limit.

When running the program with a time limit set, a correct answer will shorten the time allowed for the next problem. As long as the child continues providing correct answers, the time limit is shortened until he misses. Then the time limit is

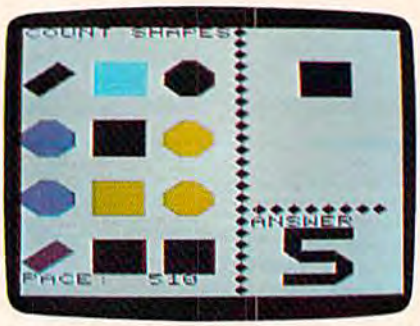
ComputerMat • Box 1664 M • Lake Havasu City, AZ 86403 *Add $1.00 For Shipping*



NUMER-BECi *teaches youngsters to recognize and count various colored shapes.*

The top arrow in ADD/SUB *reminds youngsters when to carry or borrow.*

incremented slightly. This feature challenges a child to increase the speed at which he inputs his answers.

When the program is run in the wait-for-answer mode, the child is simply asked to count the number of shapes printed on the screen. If the answer is correct, he moves on to the next problem. If the answer is wrong, the word WHOOPS! is printed in red and the correct answer is displayed.

Under the Count Colors option, the program prints shapes of different colors on the screen and the child is shown a color block and asked to count the number of shapes that match the color block. Count Shapes is a similar exercise with shapes. Shapes and colors are mixed in the final exercise. The child must count the number of black squares, or red triangles, for example.

The child's answer to each problem is printed in large block letters. It takes a second or two to appear for the answer to be printed on the screen after it has been typed in, and this can be a bit disconcerting if you're used to seeing what you type appear on the screen instantly.

Putting 2 And 2 Together

ADD/SUB is BECi's program for older children. The program, which is available for the Commodore 64 as well as the VIC-20, offers choices of addition or subtraction, one to four digits, and decimal or whole numbers. In addition, the user can decide whether to include problems that require carrying or borrowing. For those just learning about carrying and borrowing, there is an option that provides a hint in the form of a large arrow pointing to the column from which a borrow has been made or to which a carry must go.

With *ADD/SUB* you also can select a pace for solving the problems. The standard pace gives the child about seven seconds to answer. When the time is up, the computer will fill in the answer. If the wait-for-answer option is selected, the computer will wait until the numbers are filled in. The set pace option can be used to speed up or slow down the pace to meet a child's needs.

In *ADD/SUB* the problems are displayed in large black numbers with a green plus or minus sign. In multidigit problems, an arrow points to the first digits to be added or subtracted. The answers are filled in from right-to-left, just as they would be done on paper.

Using The Programs

The programs are, as advertised, easy to use. Simply load them from tape and type RUN. Options for play are presented in simple menus. To change the mode of play, press the STOP key, type RUN, and select a new option.

Loading the programs takes a few minutes; a preschooler with a short attention span might spend less time using the program than it takes to load.

The programs are low key. No scores are kept, and the rewards for correct answers are understated. The adjustable nature of the programs and the pacing options, however, provide these programs with an extended life. They are entertaining to a child just beginning to grasp the concepts covered, and they can challenge the more advanced child to solve the problems more quickly.

Computer Baseball And *Ringside Seat* For Commodore 64

Gregg Keizer, Assistant Book Editor

Ever wanted to manage your own major league team? Most people who follow baseball closely just *know* that they could take their team to the World Series, if only *they* were manager. *Computer Baseball* can give you the feeling of the close game, a pennant race, even the final game of the Series. And it costs far less than buying the Minnesota Twins, the latest team up for sale. You won't even have to pay players' salaries.

This isn't an arcade baseball game like others you may have played. Although players move and hits cross the field, the animation is minimal. *Computer Baseball* is a simulation of the strategy and tactics of a major league team. Using actual statistics, opposing managers can select lineups, choose starting and relief pitchers, set up defense for the bunt or double play, and signal runners to steal. When you put on the manager's cap, *you* make the decisions for your team, hoping to outwit the opposing manager's strategy.

The game includes 28 team rosters, World Series teams all, which you can use to play another opponent, or even the computer manager, Casey. You can even enter data for new teams yourself, or send for a disk containing the most recent American and National League teams, so you can replay an entire season if you want.

How To Play

After you've booted the disk for *Computer Baseball*, you'll be offered several choices. Do you' want to play a two-player game, play against the computer, enter new player data, or watch a demonstration game? Playing against Casey, the computer manager, is a good way to learn the game. Choosing this option presents more decisions. Do you want Casey to manage the home team, the visiting team, or both? I let Casey have the visiting team. But which team?

You'll see 28 teams listed on the screen, ranging from the '06 White Sox to the '81 Dodgers. All 28 played in a World Series, so you can replay a complete seven-game Series, or you can play a What If. What if the '27 Yankees, with Babe Ruth, could have met the '81 Yankees? Who was the better team? Has baseball gotten better, or worse? Once you select Casey's team, as well as your own, the computer will display the team lineups.

Now the decisions become more important. You can choose the starting pitcher(s) and set the batting order for your team. If you want, you can set the order for Casey's team too, but I let him do that. Although setting your batting order takes time, it adds to the game's realism. You have to fill each of the fielding positions, and you only have so many players. You could force a catcher to play outfield, but it's probably not a good idea. As you enter the order, take your time, for any errors you make means you'll have to go through it all again. Unfortunately, there's no option to change your mind in this section of the game.

The screen display appears once you've chosen your team and selected the batting order. The display shows a playing field, players, a scoreboard, and pitcher and batter status information. Once the game starts, you'll be able to tell if the batter is right- or left-handed, where the defense is playing, and the base-running abilities of men on base.

Whether your team is on the field or up to bat, you have several decisions to make. I took the field first, being the home team, so I had to choose my defensive alignment. You can play your outfielders shallow, or in their normal positions. Your infielders you can place even more carefully, moving them in, guarding the lines or setting up for the double play. You can hold base runners, if there are any, tight or loosely, depending on the situation. You can even visit the mound and talk to your pitcher, check to see if he's tired, and perhaps bring in a reliever. Make sure that your reliever is warmed up, though, or he could easily be hit off of.

When your team is up to bat, you have fewer choices to make. You can hit away, hit and

run, bunt, steal, or signal your runners to edge off the bag a bit more. If you want, you can send in a pinch runner or hitter.

Each pitcher-batter confrontation is displayed on the screen by a single pitch. There are no balls and strikes called, although batters can be struck out. A message appears at the bottom of the screen after each pitch, telling you what's happened. Pop flies, grounders, and base hits are shown to you this way. Runners advance, are thrown out, or score. Although only nine innings are displayed on the screen, extra innings are possible.

Managing It All

Computer Baseball is not for the impatient. It's not a fast-moving, arcade-style game, but it's not meant to be. Instead, the game is for those who love baseball, who have always wanted to step into a manager's cleats. As a simulation, it gives you the feeling of managing a team. Just as in reality, once the basic decisions are made, the players run, hit, and throw in their own ways. A major league manager cannot hit for a player, and neither can you in this game. The statistics of each player determine that.

Some games are pitchers' battles, with low scores. Other games display hitters' powers, and the scores run up quickly. No two games are the same. Again, that reflects the simulation's excellence. As the innings pass, your decisions on pitching and running change, just as in a real game. Strategy is vital. Outguessing the opposing manager is just as important.

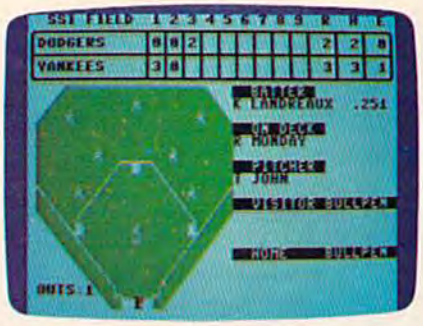
If you enjoy baseball, you'll enjoy this game. The computer takes all the routine drudgery out of keeping track of statistics and lets you concentrate on decision-making. You'll think you've paced and worried in the dugout just like a major league manager.

Ringside Seat

In many ways like *Computer Baseball*, *Ringside Seat* is a game of strategy and statistics. But instead of managing a major league baseball team, you play the part of a boxer's manager. You're not the fighter, but his manager, telling him how to fight when he's in the corner between rounds. Once the bell rings, he boxes in his own way, simply following your strategic suggestions.

When the game is loaded from disk, you have the option of managing either, both, or neither of the fighters. If you want, you can also act as the third judge in the fight, or let the computer handle it. Then you select the two boxers.

The game includes a variety of boxers available to you. Divided into weight classifications, from bantamweight to heavyweight, you simply enter the fighters' names and weight divisions. To see a complete list of the fighters on the game disk, you should press *E* the first time the computer asks you to enter a choice. After a short delay, you should press *L* to see the fighter lists, and then the weight classification. The screen will then show the fighter's identification number, his name, rating, style (slugger or boxer), and his weight division. The lists contain



The Yankees and Dodgers face off in a demo game of Computer Baseball.

The famous Dempsey-Tunney heavyweight title fight is reenacted with Ringside Seat.

current fighters, as well as famous boxers from the past. If you wanted to see how Tunney would have matched up against Foster, for example, you can create this What If scenario.

Once you've chosen the fighters and started the game, you'll see a display on the screen. The boxing ring is shown, as well as representations of the fighters, each still in his corner. Other information, such as the fighters' names, the strategy picked by each manager, condition of the fighter, from cuts to stamina remaining, and even the cumulative judges' score will be displayed. At the top of the screen you'll see descriptions of the fighters' movements during a round. Near the bottom of the screen you'll see messages displayed for the color commentary and blow-by-blow descriptions of the fight.

As in a real fight, you decide how you want your fighter to box that round. The options range from fighting flatfooted, which lets him rest in a round, saving his strength, to going for the knockout. Your fighter's abilities in each of the strategies are listed at the bottom of the screen before the round starts. Some fighters are better at charging in, while others are more effective in the stick and move. Choosing your fighter's style for that round is the most important part of managing. You have to use your fighter wisely, not overworking him, for each strategy reduces the boxer's stamina level. A more aggressive style, such as charging in, or sticking and moving, uses up more stamina than a

defensive posture, like staying away or protecting a cut.

Once the round begins, the fighter is on his own. You'll see a blow-by-blow description of the fight at the bottom of the screen, as well as see the animated figures move in the ring. The only thing you can do once the bell rings is to tell your fighter to cover up. This is helpful if he is getting badly beaten, or if he has a cut opened. Fighters jab, hook, and punch as their statistics allow. Sometimes they'll tie each other up, or back an opponent against the ropes. All you can do is chew at your fingernails, in the true manager tradition.

After each round, the judges' scores are displayed at the top of the screen, showing how each judge awarded points. Each fighter's stamina is changed to reflect how tired he is, and you can choose a different strategy for the next round. The fight continues as many rounds as you selected earlier, from a three-round preliminary bout, to a fifteen-round title fight. When the fight ends, the judges will tabulate their scores and announce a winner, unless a knockout or technical knockout has been called earlier in the fight. Whatever the decision, you can see the judges' scorecards after the fight, seeing how each awarded points and how many knockdowns each fighter had.

As with *Computer Baseball*, you have the option in *Ringside Seat* to enter new data for other fighters, or even to create a fictional boxer, giving him abilities of your own choice.

Fighting It Out

This game is much faster moving than *Computer Baseball*. In a way, that's a disadvantage, for it moves quicker because there are fewer decisions for you to make. I didn't feel as involved in this game as in the baseball simulation for that reason.

The game still gives you the flavor of managing a fighter, and of a bout itself. Pacing is important in the game, for if you expend too much energy early in the fight by constantly choosing to go for the knockout, or to charge in, your fighter will be weak before the fight ends. As the fighter's stamina falls, so does his effectiveness in many of the strategies. When his effectiveness falls below 2, his punches come with less frequency, and land less often.

As in *Computer Baseball*, the animation in *Ringside Seat* is not up to arcade standards. The sound is weak as well. But these detract little from the game's attractions. No arcade-style boxing game gives you the strategic choices and actual fighters that *Ringside Seat* does. Learning how to direct a fighter takes time and practice. This game lets you experience the thrills and agonies of professional boxing, without ever stepping into a gymnasium. Maybe *your* fighter can be a contender.

Built-In Functions

In my previous columns I've tried to show some *fun* things you could do with your computer. This month I'm going to discuss some built-in functions so you can see that your computer can perform technical tasks, and not just games, music, and graphics. Your microcomputer can do many things that the "mainframe" computers can.

The computer can be a very powerful tool in mathematical calculations. A computer can go beyond a calculator by putting procedures into a program for repetitious work or for logic-dependent answers. The slide rule generation was limited to three significant figures, and problems may have taken hours of work and pads of paper to solve. The calculators streamlined problem-solving and took the drudgery out of mathematics. Now the microcomputers can solve problems with even less time and effort—and to many decimal places of accuracy. The VIC-20 and Commodore 64 display numbers with nine significant figures (ten are stored internally).

The π key is handy in any calculations involving pi (the ratio of the circumference to the diameter of a circle). π has a built-in value on the VIC and 64 and is available directly from the keyboard. Use SHIFT and the up-arrow key to get the π symbol. Try the command PRINT π and you will get the decimal equivalent of pi. To use π in any calculations, just use the symbol. For example, try PRINT 3* π and press RETURN. This short program, "Circles," illustrates the use of this key:

Circles

```
100 PRINT "{CLR} ** CIRCLES **"   :rem 162
110 PRINT "{DOWN}ENTER THE RADIUS.{DOWN}"
                                  :rem 218
120 INPUT "R = ";R                :rem 131
130 PRINT "{DOWN}AREA = ";↑*R*R   :rem 254
140 PRINT "{DOWN}CIRCUMFERENCE = ";↑*2*R
                                  :rem 129
150 PRINT "{3 DOWN}ANOTHER CIRCLE? (Y/N)
    {SPACE}";                     :rem 254
160 GET A$                        :rem 220
170 IF A$="Y" THEN 100            :rem 38
180 IF A$<>"N" THEN 160           :rem 95
190 PRINT A$                      :rem 140
200 END                           :rem 105
```

The square root function is available on our computers. SQR(X) will return the square root of a number with the variable name of X. Try PRINT SQR(16) to get the square root of 16, or 4. Some valid statements are:

```
10 X=SQR(T)                       :rem 145
30 A=SQR(B)+3+Y                   :rem 76
70 Z=SQR(C*3+F)                   :rem 86
40 ON SQR(R) GOTO 80,100,150      :rem 186
```

"Radius" is a sample program that illustrates the use of the square root function to calculate the radius of a circle if the area is given ($A = \pi r^2$).

Radius

```
100 PRINT "{CLR}RADIUS"           :rem 189
110 PRINT "{DOWN}ENTER AREA OF CIRCLE."
                                  :rem 128
120 INPUT "A = ";A                :rem 97
130 IF A>0 THEN 160               :rem 152
140 PRINT "{DOWN}SORRY, MUST BE > 0."
                                  :rem 174
150 GOTO 110                      :rem 97
160 R=SQR(A/↑)                    :rem 220
170 PRINT "{DOWN}RADIUS = ";R     :rem 12
180 PRINT "{3 DOWN}ANOTHER CIRCLE? (Y/N)
    {SPACE}";                     :rem 1
190 GET A$                        :rem 223
200 IF A$="Y" THEN 100            :rem 32
210 IF A$<>"N" THEN 190           :rem 92
220 PRINT A$                      :rem 134
230 END                           :rem 108
```

ABS(X) is a function that returns the absolute value of a number X. The absolute value of a number is the numeric value without regard for the sign. The absolute value of a negative number is the number without the minus sign. Some valid statements are:

```
10 A=ABS(Y)                       :rem 95
20 IF ABS(SC)=100 THEN 350        :rem 67
30 T=T+ABS(T1-T2)                 :rem 210
```

Merry Christmas!

JUST AS THE DRUIDS COMPILED THE FIRST COMPUTER (Stonehenge) so they also brought the first decorated tree into the home. The winter celebration of these mystics has filled us with the desire to continue their special ways. LISTEN . . .

CASSETTALOG!

DID YOU HEAR IT? Imagine a cassette containing • Descriptions of all our games • Programming hints • Other products • **FREE GAME** • Much more! One side is programmed for the Commodore 64™. The other for the VIC 20™. Send just $2.00 to cover costs and then **DEDUCT $3.00 FROM YOUR FIRST ORDER!** Actually, the very fun of our cassettalog would make a nice Christmas present itself!

GAMES!

Standard VIC 20™ Cassette

Alien Panic	$9.95
Krazy Kong	$9.95

INT(X) returns the integer value of a number X, or the whole number part of a number which contains a decimal. The integer function truncates the decimal portion of a number, but it does not round the number. The result is always the largest whole number smaller than the given number, or the whole number to the left of a given number on the number line. Thus, INT(4.56) will be 4, but for negative numbers, INT(−4.56) will be −5. Some valid statements are:

```
10 I=INT(X/Y)                          :rem 3
30 J=J+INT(A)                         :rem 220
50 ON INT(S) GOSUB 200,250,270        :rem 43
```

SGN(X) returns the sign of a number X. The value will be 1 for positive numbers, 0 for zero, and −1 for negative numbers. This function is useful in games where the position of an object may be positive, negative, or zero in relationship to another object. The score could also be tested with the SGN function. Valid statements are:

```
10 S=SGN(X-Y)                          :rem 8
20 ON SGN(SC-T) GOTO 150,370,370 :rem 170
40 IF SGN(R)=-1 THEN 430         :rem 223
```

The following program illustrates the absolute value function, integer function, and sign function for several numbers.

```
100 PRINT "{CLR}NUMBER{3 SPACES}ABS
    {2 SPACES}INT{2 SPACES}SGN"  :rem 103
110 FOR I=1 TO 7                  :rem 10
120 READ N                       :rem 253
130 PRINT N;TAB(8);ABS(N);TAB(14);INT(N);
    TAB(19);SGN(N)               :rem 214
140 NEXT I                        :rem 29
150 DATA 3.4,0,0.6,-2.1,-5,7.2,-5.3
                                 :rem 139
160 END                          :rem 110
```

The VIC-20 and Commodore 64 have several built-in trigonometric functions. Specify a number, numeric variable, or numeric expression within the parentheses (called the "argument" of the function).

SIN(X) returns the sine of an angle specified as X radians.

COS(X) returns the cosine of an angle specified as X radians.

TAN(X) returns the tangent of an angle specified as X radians.

ATN(X) returns the arctangent of a number X. Arctangent is the angle with the tangent of X. The angle will be expressed in radians.

When you are working with angles, remember that the computer uses angles expressed in radians. Since 180 degrees equals pi radians, you can convert D number of degrees to R radians with R=D* π/180. The conversion from radians to degrees is D=R*180/ π .

If you need some of the other trigonometric functions, remember these conversions.

Cotangent (X)=cosine(X)/sine(X) or 1/tangent(X)

Secant(X)=1/cosine(X)

Cosecant(X)=1/sine(X)

Some functions are not defined for certain angles (such as the tangent of 90 degrees), and you need to be careful of overflow conditions or division by zero for the reciprocal functions.

The programs following this column illustrate the use of these trigonometric functions. Enter an angle expressed in degrees, D. Line 170 converts the degrees to radians. The sine, cosine, tangent, cotangent, secant, and cosecant of the angle are printed.

Two more technical functions are the exponential and logarithmic functions. EXP(X) returns e to the power of X, where X is a numeric expression that must be less than or equal to 88.02969191. LOG(X) returns the natural logarithm of X, and X must be a number greater than zero. No longer do you need a book of math tables, nor do you need to calculate interpolations—your computer can calculate logarithms and exponentials almost instantly. Sample valid statements are:

```
10 PRINT LOG(X/Y)                      :rem 1
20 A=EXP(B)                           :rem 96
50 G=LOG(H)-LOG(I)                    :rem 13
70 IF EXP(F)>=50 THEN 200             :rem 27
```

If the computer does not have a built-in function that you need, you can define your own function. The definition procedure is useful if you have a long mathematical formula that is used several places in the program. You can save computer memory and typing time by defining the function at the beginning of the program, then every time you need the function, it is called by the function name.

To define a function, use DEF FN with a variable name (one or two letters long) including a variable name within parentheses. For example,

```
10 DEF FNG(X)=3*X*X+4*X+2
```

Here a function G(X) is defined with a formula. Later in the program you can use a statement such as

```
50 PRINT FNG(7)
```

and G(X) will be evaluated with X=7.

The definition statement needs to be executed before the function is used in the program, so it is a good idea to put all definitions at the beginning of the program.

The above example used a function dependent upon a variable X. The defined formula does not have to contain a variable. For example, we could define a function R(Y) as follows.

```
10 DEF FNR(Y)=INT(8*RND(1))+1         :rem 93
```

R(Y) is defined as a random number from 1 to 8.

Commodore 64 and VIC-20

SuperTerm

$149.95

Telecommunications with a difference!

Unexcelled communications power and compatibility, especially for professionals and serious computer users. Look us over; **SuperTerm** isn't just "another" terminal program. Like our famous Terminal-40, **it's the one others will be judged by.**

- **EMULATION**—Most popular terminal protocols: cursor addressing, clear, home, etc.
- **EDITING**—Full-screen editing of Receive Buffer
- **UP/DOWNLOAD FORMATS**—CBM, Xon-Xoff, ACK-NAK, CompuServe, etc.
- **FLEXIBILITY**—Select baud, duplex, parity, stopbits, etc. Even work off-line, then upload to system!
- **DISPLAY MODES**—40 column; 80/132 with side-scrolling
- **FUNCTION KEYS**—8 standard, 52 user-defined
- **BUFFERS**—Receive, Transmit, Program, and Screen
- **PRINTING**—Continuous printing with Smart ASCII interface and parallel printer; buffered printing otherwise
- **DISK SUPPORT**—Directory, Copy, Rename, Scratch

Program options are selected by menus and function keys. For maximum convenience, an EXEC file sets all options on start-up. SuperTerm may be backed-up for safety. Software on disk with special cartridge module.

Write for the full story on SuperTerm; or, if you already want that difference, order today!

Requires: Commodore 64 or VIC-20, disk drive or Datasette, and compatible modem. VIC version requires 16K memory expansion. Please specify VIC or 64 when ordering.

Smart ASCII Plus . . . $59.95

The only interface which supports streaming —sending characters simultaneously to the screen and printer — with SuperTerm.

Also great for use with your own programs or most application programs, i.e., word processors. **Print modes:** CBM Graphics, TRANSLATE, DaisyTRANSLATE, CBM/True ASCII, and PIPELINE.

Complete with printer cable and manual. On disk or cassette.

VIC 20 and Commodore 64 are trademarks of Commodore Electronics, Ltd.

Now, within the program every time we need a random number from 1 to 8, we can use R(Y):

```
50 C=R(Y)                              :rem 225
80 A=R(Y)+R(Y)                          :rem 9
90 IF R(Y)>4 THEN X=2                  :rem 92
```

A defined function may combine other functions, such as

```
10 DEF FNF(X)=1-SIN(X)                 :rem 225
```

You can see that by using user-defined functions you can really customize your programs and make technical calculations less complicated.

I hope this discussion of the built-in numeric functions and the user-defined functions has shown you the powerful potential of your "home" computer. Technical applications which used to be possible only with large computers or with hours of calculation time are now possible with a combination of built-in functions on our home computers. In a later column I'll discuss the versatility of the string functions available on the VIC and 64.

Angles (VIC Version)

```
100 PRINT "{CLR}** ANGLES **"          :rem 87
110 PRINT "{DOWN}ENTER ANGLE IN DEGREES"
                                       :rem 239
120 INPUT "D = ";D                     :rem 103
130 IF D>=0 THEN 160                   :rem 216
140 PRINT "SORRY, 0<D<360"             :rem 182
150 GOTO 110                            :rem 97
160 IF D>360 THEN 140                    :rem 5
170 R=D*↑/180                          :rem 92
180 PRINT "EQUIVALENT RADIANS = ",R
                                       :rem 37
190 PRINT "SINE OF ANGLE =",SIN(R)
                                      :rem 140
200 PRINT "COSINE OF ANGLE =",COS(R)
                                       :rem 17
210 IF D=90 THEN T$="INFINITY":GOTO 240
                                      :rem 167
220 IF D=270 THEN T$="INFINITY":GOTO 240
                                      :rem 216
230 T$=STR$(TAN(R))                     :rem 62
240 PRINT "TANGENT OF ANGLE = ",T$:rem 85
250 IF T$="INFINITY" THEN C$="0":GOTO 280
                                      :rem 221
260 IF TAN(R)=0 THEN C$="INFINITY":GOTO 2
    80                                :rem 168

the 'THINK TANK'

Mirage Concepts' Power Packed Software & Your Commodore 64™!

If you've been using other software with your Commodore 64™, you have probably learned to compromise a lot! Maybe you have even considered investing in more expensive hardware. *Hold everything*...arm that Commodore 64™ with explosive firepower as well as Phi-Beta intellect! All you really need is a "Think Tank" working for you.

Mirage Concepts software:

- **Ingeniously simple to operate**
- **Unrestrained user flexibility**
- **Awesomely powerful**

Mirage Concepts brings a new definition to the phrase "Think-Tank" with the introduction of their companion WORD PROCESSOR and DATABASE MANAGER programs. Together, they bulldoze your Commodore 64™ through any obstacle...with fingertip ease! **User Confidence**–once you've experienced the simplicity and raw-power of Mirage Concepts software, you will never again settle for less! **Perfection** is the only standard we tolerate at Mirage Concepts. Put a "Think-Tank" in your Commodore 64™... ***ask your dealer for Mirage Concepts' WORD PROCESSOR and DATABASE MANAGER today. Only $99.95 each.***

CHARLES BRANNON
PROGRAM EDITOR

Mailbag

Time to bounce back some of the ideas and suggestions you've sent me. In talking about Commodore 64 video, I mentioned that the new 8-pin 64s have improved video clarity, but said that there are no functions assigned to the additional pins (previous 64s had five-pin plugs for audio/video).

J. Robinson of Santa Monica, California, differs. He's rigged up a cable using an 8-pin DIN plug (sorry, Radio Shack doesn't carry them) with the chroma (color) signal coming from pin 8. Normally, chroma is slightly distorted by the luminance mixed with it, but the signal from pin 8 is pure, and the picture is better than ever, as evidenced by some color slides Mr. Robinson sent me. If you can find an 8-pin DIN plug, try it out. By the way, DIN stands for Deutsche Industre Norm (German Industrial Standard).

We've received some letters about the Automatic Proofreader, asking how the checksum is computed on each line. We send program listings to a disk, then run our Lister program, which reads the programs straight from the disk and formats the listings with cursor controls and graphics spelled out.

In addition, the Lister automatically generates the ":rem" checksums by adding together the ASCII values of all the characters in the line. The reason that the numbers are never larger than 255 is that the addition is done internally in only 8 bits, so it will wrap around from 255 to zero (like an odometer past 99999) if the sum is too large. That's why some numbers for long lines are smaller than other numbers for short lines. It all depends where the number wraps around.

Printer Interfaces

A few issues back, columnist Larry Isaacs talked about a parallel printer interface by CardCo called Card/Print (also written as "Card/?"). We've used this interface here and have been generally pleased with its performance, although it will not translate certain 64 control codes in the listing mode.

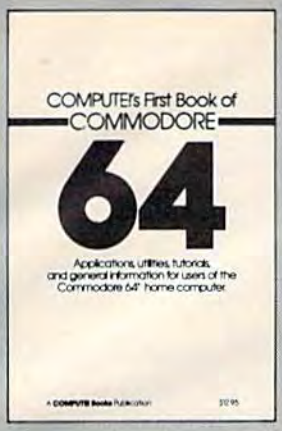
Another interface I've been using is the Tymac Connection. Unlike the Card/Print, the Connection is set up specifically for your printer (ROM chips are available for several printers). The Card/Print will work with almost any Centronics parallel printer, but the Connection uses the graphics capabilities of your Epson, Prowriter, or other dot-matrix graphics printer.

The Connection offers "almost total emulation" of the VIC printers, such as the 1525. In the emulation mode, it will respond identically to the control codes the VIC printer uses, such as dot graphics, elongated/normal text, cursor-up mode, cursor-down mode, and more. You can therefore use all the special features of your printer (high-quality print, italics, double-strike, etc.) and still be able to run programs specific to the VIC printers, such as high-resolution screen dumps.

In addition, the Connection uses your printer's dot graphics capabilities to actually print the built-in graphics characters on the keyboard. Program listings with graphics symbols will appear as they do on the screen. Unfortunately, the graphics characters are formed rather strangely. Characters which should connect, such as Commodore Q and SHIFT-asterisk, do not. The cursor symbols are hard to read. The Connection also cannot reproduce reverse-video text, since your printer's normal character set is used for alphanumerics. But support for graphics is better than no graphics symbols at all.

The Connection has a listing mode, though it cannot interpret some characters. There is also a "transparent" mode, where it just sends the characters along without any interpretation. This is what you would do with some word processing programs. Unlike the Card/Print, there is no way to "lock" in any one mode.

Hardware-wise, the Connection has a 6502 microprocessor with RAM, ROM, and a printer port. How strange to buy another computer for your 64. It has enough RAM to serve as a 2K printer buffer. With a buffer, characters coming from the computer are stored until the printer can "catch up." If you sent something less than 2K long, it would be instantly printed from the computer's



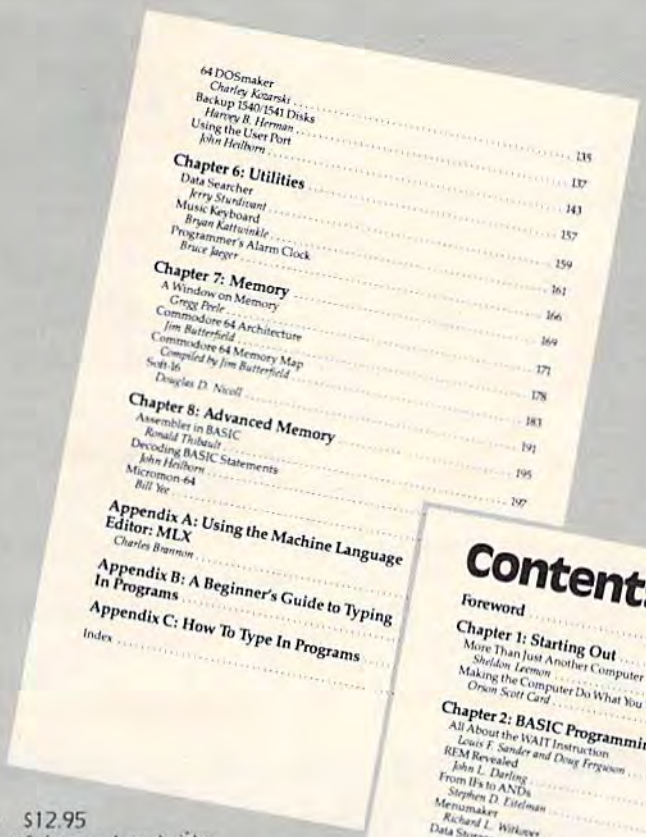
COMPUTE!'s First Book Of Commodore 64

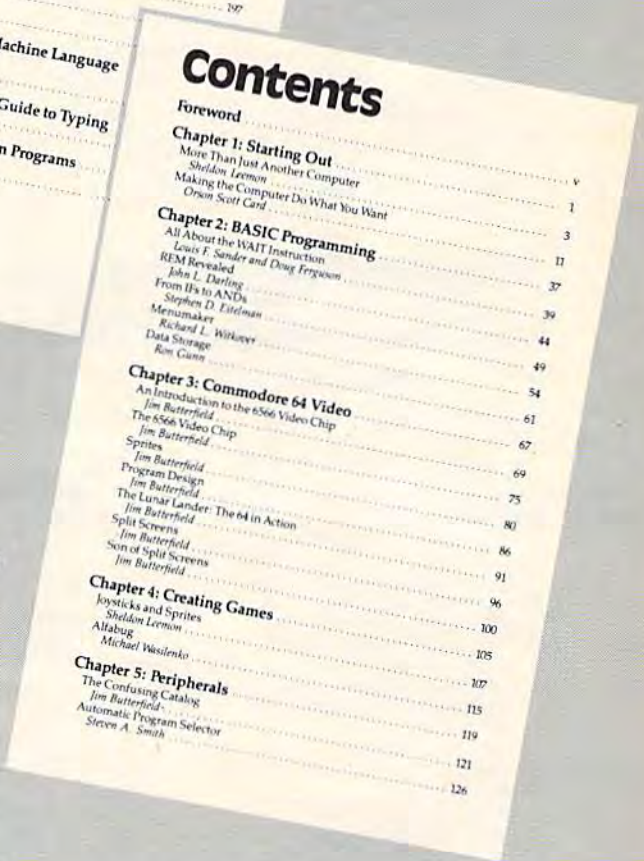
$12.95

The Commodore 64 is a powerful home computer. Its state-of-the-art features include sprite graphics and an advanced musical synthesizer chip. *COMPUTE!'s First Book of Commodore 64* is the definitive resource guide for owners and users of the 64. It includes some of the best articles and programs from *COMPUTE!* Magazine and *COMPUTE!'s GAZETTE*, plus many more that have never before appeared in print.

First Book Of Commmodore 64 contains something for everyone: BASIC programming techniques; data storage programs; examples of sprite graphics and musical synthesis; information about writing games, using peripherals, and working with many utilities (including a machine language assembler and a monitor); a complete memory map; and advanced programming techniques. Also includes many ready-to-type-in programs and games.

If you are a Commodore 64 owner who wants to learn more about using your computer to its full potential, this is the book for you.





Now Available From COMPUTE! Books

- *COMPUTE!'s First Book Of 64 Sound & Graphics* $12.95
Clear explanations to help you use all the 64's powerful sound and video features. Plus great programs for music synthesis, hi-res art, and sprite and character design.

- *COMPUTE!'s First Book Of Commodore 64 Games* $12.95
Packed full of games: Snake Escape, Oil Tycoon, Laser Gunner, Zuider Zee. Arcade-action machine language games for fast hands; strategy games for sharp minds.

- *COMPUTE!'s Reference Guide To 64 Graphics* $12.95
A complete, step-by-step tutorial for programming graphics. You'll like the clear writing, the example programs, and the full-featured sprite, character, and screen editors.

- *Creating Arcade Games On The 64* $12.95
The principles and techniques of fast-action game design, including custom characters, movement, animation, joysticks, sprites, and sound. With complete example game programs.

- *Commodore 64 Games For Kids* $12.95
Dozens of games for kids of all ages, making this an instant library of educational software. Learning, creativity, and excitement.

How To Order

COMPUTE! Books are available at bookstores, newsstands, and computer stores nationwide. If your local store has run out of **COMPUTE! Books** or does not carry them, you can order them directly:

By Mail. Send a check or money order in U.S. funds (no cash please) to: Order Department, COMPUTE! Books, P.O. Box 5406, Greensboro, NC 27403. Please include $2 shipping/handling for each book you order. All orders must be prepaid. (C.O.D. orders are not accepted.) Allow 4–6 weeks for delivery.

By Phone. If you have VISA, MasterCard, or American Express, call our **toll-free number 800-334-0868** (919-275-9809 in NC) between 8:30 AM and 4:30 PM, EST. Your order will be processed promptly; we will bill your credit card (plus $2 shipping/handling). Allow 4–6 weeks for delivery.

COMPUTE!™ Publications, Inc.
One of the ABC Publishing Companies

point of view. The buffer would meanwhile be feeding characters to the printer at the printer's speed. My printer has a 2K buffer, so the combination of the printer and the Connection gives me an effective 4K of buffer space.

Strange Lock-Up Bug

It may have happened to you. It's extremely frustrating, and totally unexpected. Fortunately, it's predictable, hence preventable. Go down to the bottom of the screen (the very bottom, the last line, scroll if you have to). Now start typing. Anything. You could just type a bunch of X's. Keep typing as you wrap around the right margin on the first line, then stop right after you type past the right margin of the second 40-column line (the screen will scroll). Now press the INST/DEL key (unSHIFTed) to erase the last character on the previous line.

Whoa! Suddenly, the command LOAD is printed, you get a ?SYNTAX ERROR, the word RUN appears, and if you had a program in memory, it starts. Who typed SHIFT-RUN/STOP?

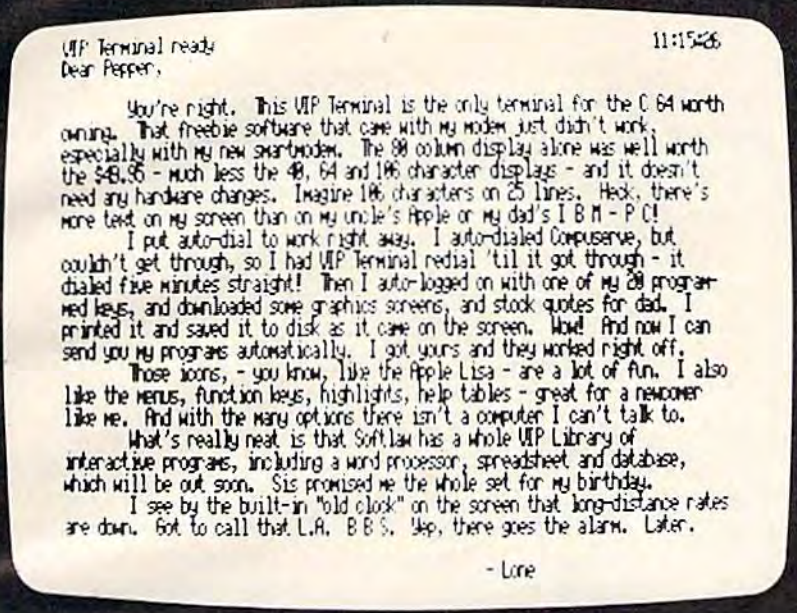
This is not a trivial error. If you had a program running, you can't stop it. If not, the cursor appears to be flashing merrily, and all seems well. Try typing. Worry begins to creep into your mind as no characters appear. You reach for the panacea of RUN/STOP-RESTORE. Panic sets in when this does nothing, and you press it over and over again, pounding and smashing at the keyboard in a frantic attempt to regain control. Too bad. You have to reach for the power switch and turn your computer off. RAM is wiped clean. Your program, if any, is gone.

I don't know what causes this error. One theory is that when the 64 tries to scroll color memory, it reaches one line too many past $DBE7 (end of color memory) and mangles the registers of the CIA chip, which controls all interrupts. There is no way around it, other than the emergency reset I covered last month. Just keep it in mind.

Hope you enjoy the word processor in this issue. Since it is a complex software product, we'll use this column in the future as a forum for answering your questions about it, as well as tips for using it.

I'll leave you with something to play with: extended background color mode. Enter it with POKE 53265,PEEK(53265)OR64 and try typing the letter "A", SHIFT-A, then CTRL-9 (reverse on), and inverse video "A" and SHIFTED-A again. See what conclusions you come up with, and try changing memory locations 53282 and 53283.

80 Column Smart Terminal
For Your C64 Without Any Hardware Change!



VIP TERMINAL™

They're right! To start with the best you've got to have the **VIP Terminal!**

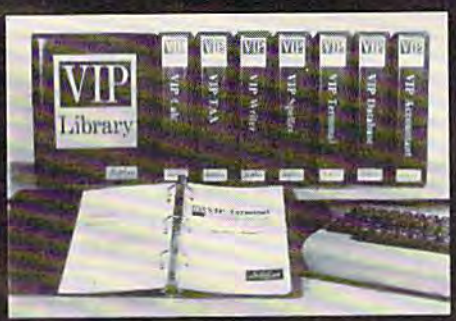
- **Built-in 40, 64, 80 and 106 columns**
- **Word wrap for a formatted display**
- **Talk to any computer**
- **Use any modem and printer**
- **Written in fast machine code**
- **15 entry phone directory**
- **20 programmable keys**
- **Automatically dial, redial, upload, download and log-on**
- **Professional 96 character ASCII display**
- **128 character ASCII keyboard**
- **Simultaneous on line printing and saving of files to tape and disk**
- **Use and save files as big as your disk!**
- **E Mail & E-COM Compatible**

Get yours NOW! **$49.95**

Introducing The VIP Library

The Library Concept

The **VIP Terminal** is only the first in a whole series of elegant software for your Commodore 64 called the **VIP Library.** This complete collection of easy-to-use, serious, high quality, totally interactive productivity software includes **VIP Writer, VIP Speller, VIP Calc, VIP Database, VIP Disk-ZAP, VIP Accountant and VIP Tax.** All are equal in quality to much more expensive software for the IBM PC, and all are very affordable!



Virtual Memory

VIP Library programs are not limited by the size of your computer's memory. All programs use virtual memory techniques to allow creation and use of files larger than your computer's available work area. You're only limited by the space on your disk!

Icons Make Learning Easy

Hi-res technology and sprites allow **VIP Library** programs to bring you task Icons, made famous by the Apple Lisa™ and the Xerox Star™. With these advanced sprite representations of the task options open to the user, even the total novice can, at a glance, perform every task with ease. Just look at the icon and press a key! No programs are easier or more fun to learn and use!

Total Compatibility

All **VIP Library** programs are compatible with each other and other computers for easy file transfer. Each uses ASCII, the universal language of computer communications so that files can be sent to and received from other computers without modification! The Library also gives you the benefit of a consistent icon and command structure. Once you have learned one program, the others will come easily.

For Orders ONLY — Call Toll Free —

1-800-328-2737

MAIL ORDERS: $3.00 U.S. Shipping ($5.00 CANADA; $10.00 OVERSEAS. Personal checks allow 3 weeks.

Professional Displays

The 40-characters-per-line display of the Commodore 64 is inadequate for serious computing. An 80-column display is the industry standard. **VIP Library** programs bring this standard to your Commodore 64 with state-of-the-art graphics, without need for costly hardware modifications. With **VIP Library** programs you can freely choose from four displays: the standard 40 column display, plus a 64, 80 and even a 106 column by 25 line display. With these programs you can have more text on your screen than on an IBM PC or an Apple IIe with an 80-column board! Welcome to the professional world!

Who Is Softlaw?

Softlaw Corporation has years of software experience in micros. We currently offer the full-line **VIP Library** for other micros in the U.S. and in Europe. Now we are bringing this experience to the Commodore 64 so you get ultra-high quality software at very affordable prices.

Softlaw

DAN CARMICHAEL, ASSISTANT EDITOR

Using The Dynamic Keyboard

The *dynamic keyboard* is a useful programming technique that can be used with both the VIC-20 and the 64. This technique enables you to POKE values into the *keyboard buffer* and "fool" the computer into thinking you typed the command from the keyboard. It can be used to do everything from simply running a program to chain-loading programs from tape or disk.

The Keyboard Buffer

The keyboard buffer is a block of memory ten bytes (characters) long that runs from memory addresses 631 to 640. The buffer is a temporary holding area that is used to store data input from the keyboard. If you could type faster than the VIC could read the keyboard (it does this 60 times a second), you could fill up the keyboard buffer. Obviously you can't type this fast, but there are other times the computer's operating system does use the keyboard buffer to temporarily store data. If a BASIC program is running and is at a stage where it is not ready to accept data input from the keyboard (a FOR/NEXT time-delay loop, for example), the keys that are pressed will be temporarily stored in the buffer until the program is ready to process the data. To see how this happens, enter the following line in the direct mode, press RETURN, and while the FOR/NEXT loop is running type the following ten keys: 1 2 3 4 5 6 7 8 9 0.

```
FOR A=1 TO 10000: NEXT
```

As you can see, while the time-delay loop is running, the keys you pressed are not displayed on the screen. As soon as the loop is finished, the computer reads what is stored in the keyboard buffer and processes the data accordingly and prints it on the screen. Now enter the above FOR/NEXT statement again, and while it is running type the following 12 keys: 1 2 3 4 5 6 7 8 9 0 1 2. When the loop is finished, you will see the same ten keys displayed on the screen as before. But what happened to the two extra keys that were pressed, the 1 and 2? Those keys were lost because the keyboard buffer, which runs from 631 to 640, can hold a maximum of ten characters. Any keys that are pressed after the buffer is filled are lost.

The Other Keyboard Buffer Byte

You may wonder how the operating system knows that there is data in the keyboard buffer waiting to be processed. Memory address 198 tells the computer how many characters are in the keyboard buffer ready to be processed. Each time you pressed a key while the computer was executing the above time-delay loop, memory location 198 was incremented by 1. After the loop finished running, the operating system took a look at location 198 (which had a value of ten) and knew that there were ten characters in the buffer waiting to be processed. Enter the following commands in the immediate mode, then while the FOR/NEXT loop is running, type 1 2 3 4 5 6 7 8 9 0.

```
FOR A=1TO10000:NEXTA:POKE 198,0
```

After the loop is finished, you'll notice that our ten characters were not printed on the screen. The reason is that after we came out of the loop we POKEd 198 with a 0. Even though our ten characters *were* in the cassette buffer, the operating system didn't print them as it did before. When we POKEd a value of zero into 198, we told the computer no characters were waiting in the buffer.

Using The Dynamic Keyboard

The keyboard buffer can be a very useful tool when properly used. For example, did you know that when you "chain-load" programs (the first program automatically loading and running the second, the second loading the third, and so on) the

THE VIC LIBRARY FROM COMPUTE!

For over two years, COMPUTE! Magazine has been publishing articles and ready-to-type-in programs for VIC-20 owners. Many VIC programming techniques first appeared in the pages of COMPUTE!.

COMPUTE!'s editors have gathered the best articles (revising and rewriting some) and added previously unpublished material. The result is a series of books for VIC-20 owners. Each contains articles and programs which educate, explain, and entertain.

Whether you're brand-new to computing or a seasoned programmer, you'll find fun and useful information, written in COMPUTE!'s easy-to-understand style, in all of these books. And if you know other VIC owners, COMPUTE! books make wonderful Christmas gifts.

COMPUTE!'s First Book of VIC $12.95

COMPUTE!'s First Book of VIC has been a number one best seller on the computer book lists. It has been called "useful for both novice and experienced VIC users."

If you like computer games, you will enjoy "STARFIGHT3," "ZAPII," "Meteor Maze," and the other games included. Chapters on joysticks and paddles explain how to use them in programs you write.

First Book of VIC shows you a simple way to alphabetize lists. And there are advanced programming techniques for saving memory space.

The custom character program allows you to design your own alphabet (if you want your VIC to print Hebrew, Greek, or other special characters). Custom characters can be developed into spaceships, flowers, and other unique shapes.

You will discover how to automatically renumber BASIC programs, combine two programs, start and stop the screen when it is LISTing, and dump the screen to a printer.

If you write programs, you will appreciate the discussion of VIC memory and how to create special effects with graphics and sound. The machine language monitor, TINYMON, is a valuable aid to machine language programmers.

COMPUTE!'s First Book of VIC was one of the first books published for VIC owners and it is still one of the best. VIC owners of all ages and abilities will find it an excellent resource.

COMPUTE!'s Second Book of VIC $12.95

Your VIC library is not complete without *COMPUTE!'s Second Book of VIC*.

Some of the outstanding programs include: a datassette filing system that lets you use your VIC as a filing cabinet; a mini word processor; a loan analyzer that figures out interest, monthly payments, and loan values; a machine language assembler (and a very fast machine language game); a program for printing poster-sized banners; and much more.

Second Book of VIC features a detailed memory map (including Kernal routines) that not only names the memory locations, but also gives you ideas for using them in your programs.

Chapters on graphics and sound include a character editor that redefines character shapes, a sound effects program that does not slow down BASIC programs, and a utility for programming the eight function keys.

And, of course, there are ready-to-type-in games: "UXB," "A Day At The Races," and others. If you write your own games, you will benefit from the techniques and examples throughout the book.

People who are curious about the many things you can do with a VIC need *COMPUTE!'s Second Book of VIC*. The variety of programs will be a welcome source of new software. Why not order your copy today?

COMPUTE!'s First Book of VIC Games $12.95

Would you like a lot of games at a very low price? *COMPUTE!'s First Book of VIC Games* contains two dozen (for only $12.95). Each game has been tested and debugged, and is ready to type into your VIC-20.

You get fast-action, commercial quality, arcade-style games that require quick reflexes in addition to strategy games which test your logical skills.

In "Time Bomb" you hear the ticking of a bomb about to blow up. You have to find and defuse it by making your way through the maze that extends beyond the borders of the screen.

"Closeout" takes you to a department store. You try to snatch as many sale items as possible, while avoiding the horde of nasty bargain hunters.

"Cryptic Numbers" combines logic and luck. Thinking logically, you have to decode the pattern picked by the VIC. After each turn you learn how close you were.

"Deflector" requires quick reactions and a sense of strategy. You control the bouncing ball by placing deflectors that direct it to the targets.

You are captain of a small space fortress in "Outpost." You have lasers and torpedos, but your energy is running low and the computer is on the blink. Will the supply ship arrive in time to save you?

First Book of VIC Games is more than just a book full of program listings. Each game is annotated. You can change the games if you like, or use the many programming techniques in games you write. And you can use the maze-drawing program in your own games.

Introductory chapters explain how to develop ideas for game programs, with hints and tips about the VIC's sound, color, and graphics capabilities.

No serious game player should be without *COMPUTE!'s First Book of VIC Games*.

first program has to be longer than the second? That's because of the variables. The start of BASIC variables always stays just past the end of your BASIC program. When you chain-load programs, any variables that are used in the first program are stored a few bytes past the end of BASIC. If the second program in the chain is longer, it will write over these variables, and all their values will be lost. To illustrate this, enter the following two short programs and save them to tape with the filenames specified below. Be sure to save the second program with the filename "TEST.LOAD.2" right after the first program (use the filename TEST.LOAD.1).

TEST.LOAD.1

```
10 A=10:B=20:C=30                    :rem 120
20 PRINT"{CLR}{DOWN} THIS IS PROGRAM 1"
                                     :rem 244
30 FORT=1TO500:NEXT                  :rem 189
40 LOAD"TEST.LOAD.2"                 :rem 182
```

TEST.LOAD.2

```
10 PRINT" THIS IS A DUMMY LINE"   :rem 251
15 PRINT" THIS IS A DUMMY LINE"     :rem 0
20 PRINT" THIS IS A DUMMY LINE"   :rem 252
25 PRINT" THIS IS A DUMMY LINE"     :rem 1
30 PRINT" THIS IS A DUMMY LINE"   :rem 253
35 PRINT" THIS IS A DUMMY LINE"     :rem 2
40 PRINT" THIS IS A DUMMY LINE"   :rem 254
50 PRINT"{CLR}{DOWN} THIS IS PROGRAM 2"
                                     :rem 248
60 PRINT"A=";A;"B=";B;"C=";C         :rem 41
```

As you can see, the first program sets three variables (A, B, and C), PRINTs a quick message to the screen, then LOADs in the second program, which prints a few messages to the screen (we made it longer here for our demonstration). It then prints the variables A, B, and C that were set during the first program. Note that the printed variable values are zeros, even though we initially set them at 10, 20, and 30, respectively.

What's the answer? The dynamic keyboard, of course. Change the last line (line 40) in the first program to read:

```
40 POKE 631,131 : POKE 198,1
```

Then reSAVE it using the same filename, and RUN it again. For our demonstration, this modification will work only with cassette. Save this modified version to tape, and be sure to save another copy of the second program right after it.

If you changed line 40 and saved both programs correctly, you'll notice that the first program successfully called in and ran the second, even though we removed the LOAD command in line 40.

This is accomplished by the two POKEs we used in line 40. POKE 631,131 places the token for SHIFT-RUN into the keyboard buffer. When you press SHIFT and RUN on the keyboard to LOAD and RUN a tape program, this character (131) is placed in the buffer. Jot this down; you probably won't find it in your *VIC-20 Programmer's Reference Guide*. We POKEd the SHIFT-RUN into location 631, the first byte of the keyboard buffer, because the buffer is of the FIFO (first in—first out) type. That is, when you press a key on the keyboard, the operating system places it in the first byte of the buffer; when ready to be processed, this will be the first character pulled out.

The other POKE we made in line 40 was POKE 198,1. This tells the operating system that there is one character in the buffer waiting to be processed. As soon as the 1 was POKEd into 198, the operating system was fooled into thinking you had typed SHIFT-RUN from the keyboard, and the computer LOADed and ran the next program.

The obvious drawback here is that it will only LOAD and RUN the next program *on tape*. This is because the POKEs we used did not specify a filename. So when using this method of chain-loading, be sure the programs are saved one after the other.

You'll notice that we still have a problem passing variables because of the longer length of the second program. There is another technique which can easily solve that.

Using The Buffer And The Screen

Delete line 40 from the first program and add the following lines:

```
32 PRINT"{CLR}{2 DOWN}LOAD"          :rem 11
40 PRINT"{6 DOWN}5 A=";A;":B=";B;":C=";C;
                                     :rem 113
45 PRINT"RUN"                        :rem 47
50 POKE631,19:FORA=632TO636:POKEA,13:NEXT
   :POKE198,6                        :rem 96
```

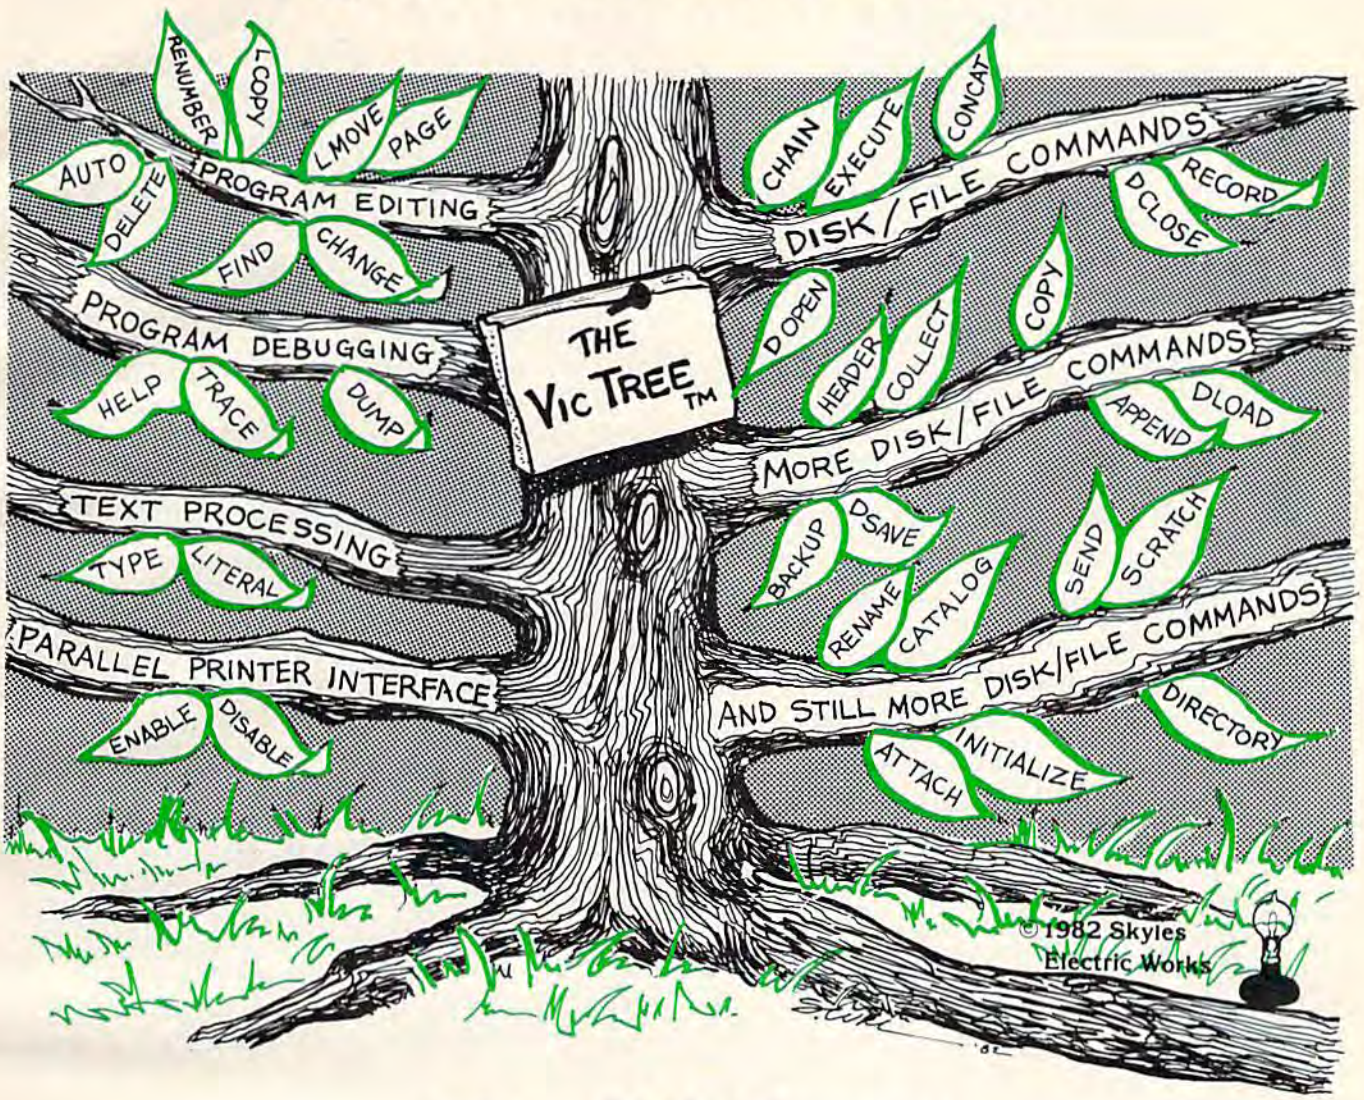
As before, SAVE it to tape and reSAVE the second program right after it. Now RUN the first program and see what happens. Be sure to leave the cassette PLAY button pressed down after the first program is loaded.

This time we've successfully passed our variable values from the first program to the second. Here's how we did it.

Line 32 clears the screen (which also moves the cursor to the HOME position). It then moves the cursor down two lines, and prints the word LOAD. Line 40 shows how we pass our variables from one program to another. It prints a line on the screen that looks like (and is) a BASIC statement: the number 5 (the BASIC line number) and the variables A=, B=, and C=. It then prints the current value of these variables, in this case 10, 20, and 30, respectively. Line 45 prints the word RUN and starts our second program.

Line 50 is the key to it all. The first POKE (POKE 631,19) places the value 19 into the first byte of the keyboard buffer. In this case, the ASCII

Skyles Electric Works Presents



The VicTree™

...Leaves your new Commodore 64 (or Vic 20) with 42 additional commands.
...Branches out to most BASIC 4.0 programs.
...Roots into most printers.

New from Skyles: the VicTree, a coordinated hardware and software cartridge that allows your Commodore 64 to branch out in unbelievable directions and makes it easier than ever to do BASIC programming, debugging and to access your disk. And the new VicTree provides routines to interface the Commodore 64 to all Centronics Parallel printers with an inexpensive cable. 8kb of ROM—4kb for the BASIC commands, 4kb for disk commands. Perfect not only for the new Commodore 64 but also for the Vic 20. Unbelievably simple to use with a 100+ page manual with many many program examples. Easy to install, plugs into cartridge port, the VicTree gives you all the additional BASIC 4.0 commands to allow most BASIC 4.0 programs to work on your new Commodore 64 and Vic 20.

And now with the BASIC command Commodore forgot!

Now only $89.95 or **$109.95** complete with Centronics standard printer cable. (Cable alone $29.95.)
Available now from your local dealer or order through your Visa or MasterCard toll free:
(800) 227-9998 (California, Canada, Alaska, Hawaii: (415) 965-1735) or send check or money order directly to:

Mountain View, CA 94041
(415) 965-1735

value of 19 is the control character which stands for HOME CURSOR. The cursor, then, is simply moved to the home position (the upper-left corner) without clearing the screen. The next five POKEs we make to the keyboard buffer are the same (a value of 13), and are done with a FOR/NEXT loop. The ASCII value of 13 is the control character which represents the RETURN key. POKE 198,6 fools the operating system into thinking that six keys have been pressed on the keyboard. The computer starts processing these commands, and away we go. Here's what happens.

The value of 19 moves the cursor to the HOME position, and then the operating system automatically moves it down one more line. The cursor is now sitting on top of the word LOAD we printed on the screen. The next character in the keyboard buffer is a 13, which stands for RETURN. We've fooled the computer into thinking that we typed the word LOAD and then pressed RETURN. The system now loads in the next program on the tape. While the computer is loading the program, the processing of data in the keyboard buffer is temporarily suspended.

After the LOAD has been completed (we now have the second program in BASIC memory), the operating system continues reading data from the keyboard buffer. The next few bytes in the buffer stand for RETURN. The cursor is now sitting on the BASIC line we printed on the screen in the first program. When the computer reads the next value of 13 from the keyboard buffer, it is again fooled into thinking we have just typed in a new BASIC line for the second program. It then enters that line. The cursor has now moved to the next line on the screen, which reads RUN. Reading another 13 from the buffer, it thinks we typed RUN from the keyboard and pressed RETURN, and away it goes with the second program.

Many Different Techniques

The above techniques could have been accomplished a number of different ways using the keyboard buffer and the screen. Just remember one important fact. In most cases, when the computer reads data from the buffer, it thinks it was entered directly from the keyboard. Almost anything you can do from the keyboard can be done from the keyboard buffer. As a matter of fact, you could probably create a computer program itself by POKEing various values into the buffer.

Experiment with this technique and I'm sure you'll find a useful application for it.

If you've got questions or ideas about subjects you'd like to see covered in this column, write to: VICreations, c/o COMPUTE!'s GAZETTE, P.O. Box 5406, Greensboro, NC 27403.

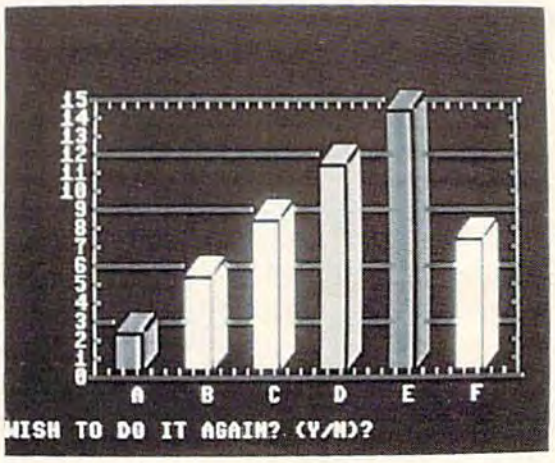
Graph Plotter

Ruth A. Hicks

Not only is "Graph Plotter" an interesting tool for drawing 3-D columnar charts, but the accompanying article takes you step by step through the program itself so you can learn how it was written. The program originally was designed for the Commodore 64, and we've added a version for the unexpanded VIC-20.

"Graph Plotter" is a good demonstration of what beginning programmers can accomplish in the way of graphics on the Commodore 64 and VIC-20. Different graphics techniques were used to create this program. By reading this article and following along with the program listing, you can increase your knowledge of graphics formatting. Of course, if you're not into learning programming, there's no reason why you can't just type in the program listing anyway.

Graph Plotter creates attractive bar graphs with three-dimensional columns. The graphs are particularly exciting in color. There are six columns, each a different color, to which you assign a value from 0 to 15 for the column height. You tell the computer what values each column has, and then you can interpret their meaning.

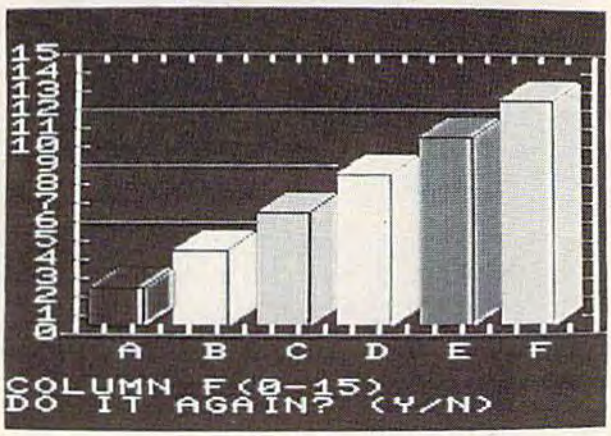


3-D bar graphs are a snap with "Graph Plotter" (64 version).

Modular Programming

Graph Plotter was written with a technique known as *modular* or *block programming*. This means a section at a time was written on the computer and then checked for eye appeal, function, and (of course) that familiar message, "?SYNTAX ERROR." There are five main blocks to this program.

When typing the program, I suggest that you omit unnecessary spaces except in any INPUT or PRINT statements between quotation marks. All



The VIC-20 version of "Graph Plotter."

other spaces are not needed by the computer and only consume more memory. Since this is an article to learn from, let's start some good habits right away by not typing those useless spaces.

Block One

Block one, lines 100-180, creates the graph, including the segments and the outlining border. Instead of using line after line of PRINT statements, we'll be POKEing the information directly into memory inside FOR/NEXT loops.

Line 100 clears the screen and sets the background color to black and the border blue. Line 110 starts the top border on the Commodore 64 at screen memory location 1230 and runs it across the screen to location 1261, drawing a continuous line (these addresses are 7726 to 7745 on the VIC). Refer to the manual which came with your computer for the "Screen and Color Memory Maps." Each time the FOR/NEXT loop is executed, it places the new value of I into the POKE statement with the symbol number 114 (refer to your manual, "Screen Display Codes"). The I value tells the computer *where* to put the symbol and the 114 tells *what* symbol to put in that spot.

The second POKE in line 110 colors the symbol green. Since the "Color Memory Map" (see manual) corresponds to the screen memory map, only with a different set of numbers, all we have to do is calculate the offset. The difference between 55296 and 1024 (the starting address of color and screen memory in the Commodore 64) is 54272, a simple subtraction problem. So, we POKE I+54272 with the color code for green (5) and presto, we have a green symbol at the correct location! The same thing works on the VIC-20, except the offset between screen and color memory is 30720 instead of 54272.

Line 120 draws the left border, beginning at screen memory location 1270 and ending at location 1790 on the Commodore 64 (7748 to 8034 on the VIC). The STEP 40 is used because a Commodore 64 has 40 characters per line across its screen (STEP 22 for the VIC). If you look at your manual and find screen location 1270, then add 40, you'll find that location 1310 is exactly one line below 1270. On the VIC, 7748+22 adds one screen line. The rest of line 120 and the next two lines are similar to lines 110 and 120, except for different screen symbol codes.

The last four lines (150-180) in this section were constructed in the same manner, using FOR-NEXT loops to POKE information directly into screen memory. These lines draw continuous lines on the graph, making it more readable.

Designations

Block two of the program prints a series of numbers on the left side of the graph and letter designations for each of the six columns. Line 190 positions the following PRINT statement at the right spot horizontally so the numbers can be displayed along the left side of the graph. We want the numbers to start at the fourth space right of the border, so we place a SPC(4) after the PRINT, and then place the number to be printed inside quotation marks.

So, lines 190 through 220 label the Y-axis with a sequence of numbers from 15 to 0. Notice that between each colon is a complete PRINT statement, and even though they are all crunched together in only four program lines with *no spaces*, they result in 16 lines of vertical display. Also, notice that with one-digit numbers the SPC() statement is increased from four to five in the Commodore 64 version for proper placement.

The last line of this section (230) puts letter designations along the bottom of the graph beneath the columns. Notice there is only one PRINT since this line is displayed horizontally. In the Commodore 64 version, the first letter is positioned with TAB(9) and the following letters are all equally spread with SPC(4) statements. Again, because of the VIC's smaller screen size, a TAB(4) and SPC(2) statement are used to position the letters properly.

READ-DATA Block

In the third block of the program (lines 240 to 300), DATA is READ that will be used in a later routine to position each vertical bar on the graph and decide its color. Line 240 prevents this DATA from being reREAD unnecessarily with any subsequent passes through the program.

The first statement that READs DATA in this section is in line 260. Here, a READ command is contained in a FOR-NEXT loop so it is executed six times. This causes six strings, representing the six column labels (A,B,C,D,E,F) to be READ and set equal to the string array variable, A$(I).

In line 280, a second set of DATA is READ and assigned to D(I). This string array variable denotes the color code for each vertical bar on the graph.

The last group of DATA in this block is READ from line 300. The values taken from line 290 are the screen memory addresses necessary to properly locate each bar on the graph.

The use of arrays in this section significantly shortens the length of the program. Instead of requiring six separate blocks of code to locate and draw each vertical bar, we will now be able to perform this in one routine.

Input Block

The fourth block of the program (lines 310-420) is the INPUT routine. Notice that that much of this routine is contained within a FOR/NEXT loop

ACADEMY SOFTWARE

P.O. Box 6277, San Rafael, CA 94903 (415) 499-0850

Programmers: Write to our New Program Manager concerning any exceptional VIC 20™ or Commodore 64™ game or other program you have developed.

(lines 310–370).

In this loop, you are asked what value you want for each column. The value that you INPUT determines the height of each vertical bar. Your response is checked in line 360 to make sure it is within the limits of 0 and 15.

After INPUTting the height of each column, the screen memory address (A) for the top of the column is determined by the first statement in line 370.

Here's how it works: A(J) was set as a starting screen location in the first line, then AA (the response) is multiplied by 40, because our screen is 40 characters across (22 for the VIC version). Then AA times 40 (or 22) is subtracted from A(J), because the columns are drawn upward. So, if the response is 10, the column rises 10 segments high. Then 80 (or 44 on the VIC) is added to A to bring it down two rows so we have room for our three-dimensional side. Program execution is then transferred to the subroutine at line 430, which actually draws each column on the graph.

In the process, the variables necessary to this subroutine are passed. The variable C defined in 310 is the offset between the screen memory map and the color memory map as explained above. The actual color of each column (variable D) and the starting screen location of each column, or variable X, are also transferred.

Once a column has been drawn, the user's previous INPUT is erased in line 320 by POKEing blank spaces into this area of screen memory. If you didn't do this, the prior answer, of course, would remain on the screen.

Line 320 enables you to position a PRINT statement exactly where you want vertically without disrupting any printing already on the screen. The cursor is first HOMEd, and then a blank PRINT statement is placed inside a FOR-NEXT loop. As the loop is executed, starting at the HOME position, it counts down vertically to the maximum number set by the FOR-NEXT loop.

The next line is the INPUT statement, now in the right position to be printed. At the end of the INPUT statement is the variable AA, which receives whatever value you enter between the limits of 0 and 15. If the response is less than 0 or greater than 15, the computer erases the answer and asks the same question again.

Once all six vertical bars have been drawn, you will be asked in line 390 if you wish to do another bar graph. If you do, the program will start again at line 100. Otherwise, it will END in line 420.

The Subroutine

The heart of this program is the subroutine beginning at line 430. This is the block which draws the columns by POKEing symbols onto the screen.

Let's start explaining this section with lines 430 and 440. These two lines check to see if the value AA from the INPUT block is a 1 or 0. If AA = 1, the program branches to line 530, which draws the top of a column one segment high on the graph. When AA = 0, it is a null entry, and the program gets another INPUT.

Lines 470 and 480 begin to actually draw the columns, which are three characters wide. Reflecting back to the INPUT block, you'll recall that variables A and X were set for the starting point and top part of the column. So, by POKEing the screen memory locations with the desired character symbols in a FOR-NEXT loop, we can draw the columns to any height we've chosen. Notice there are three POKEs, I, I + 1, I + 2. Each addition to I moves its location over one spot to the right, yielding a three-character-wide column. The different screen display codes create a three-dimensional appearance with reversed characters. The program reverses the character codes by adding 128 to the symbol code (32 + 128 = 160, 101 + 128 = 229). Line 480 follows up line 470 with the color information by adding the color variables C and D to the same locations from line 470.

Lines 510-540 follow the same format as lines 470 and 480. They draw the three-dimensional top segments of the columns. Six character symbols and six color locations are POKEd into the appropriate locations with the variables A, C, and D. By adding or subtracting numbers from A, we can position the symbols on the row above or to the right.

Once this subroutine is completed, line 550 RETURNs to the INPUT block.

Formatting

By now, you should have "Graph Plotter" typed in and SAVEd on tape or disk. The difference between this program and others you have typed is that you now know exactly how it was programmed. Remember the techniques of using PRINT statements for displaying characters vertically and horizontally; of blank PRINT statements and SPC() commands for positioning INPUT or PRINT statements exactly where you want them; of directly placing symbols and colors onto the screen with POKEs and variables. In planning your own programs, use these techniques for your screen displays and see how handy and time-saving they can be for you.

See program listings on page 202.

Please enclose your phone number with any orders.* ***SHIPPING — Software:*** *$2.50 minimum.* ***SHIPPING — Hardware:*** *(Please call)* ***SHIPPING — Foreign Orders:*** *APO & FPO orders: $10 minimum and 15% of all orders over $100. Nevada residents add 5 3/4% sales tax. All goods are new and include factory warranty. Due to our low prices, all sales are final. All returns must be accompanied by a return authorization number. Call 702-369-5523 to obtain one before returning goods for replacement.*

MACHINE LANGUAGE FOR BEGINNERS

RICHARD MANSFIELD, SENIOR EDITOR

Addressing

You'll soon notice that most of your ML programming involves sending bytes around in the computer's memory. It's quite similar to PEEKing and POKEing, but you've got more options on how you *address* these bytes before you send them somewhere. Addressing bytes is like addressing a letter—you want it to get to its destination so you must write the destination on the letter. There are even ways to send the byte c/o another address, but we'll get to that in a minute. First, we need to review our all-ML game in terms of some addressing options we can use when writing an ML program.

A Cumbersome List

So far, our ML game can be divided into three sections (like subroutines). Let's use the 64 version, Program 2, as our example this month; it's essentially the same as the VIC version. The first section (from address 49152 through 49169) puts the number 8 into all the addresses of Color RAM memory. We usually have a choice of which ML *addressing mode* we want to use. We could have used the simplest mode, absolute addressing, and just listed every address we wanted to POKE the 8 into. It would have looked like this:

```
STA 55296
STA 55297
STA 55298
STA 55299 and so on
```

but that's pretty inefficient. We would have had to list a thousand addresses. Instead, we chose to do our POKEing within a loop. The Y register is quite useful for addressing things because it can be used as an *offset*. That is, you can address something so that the actual address you give is *added to whatever Y equals at the time*. This is a special form of absolute addressing called *absolute indexed* (you can use the X register this way too).

How does it work? First we set Y to equal zero (at 49152). Then we load the A register with our color value, 8. Then we have four STAs lined up, using the absolute indexed addressing mode. The first time the computer comes across this list, it will put 8 into 55296, 55552, 55808, and 56064. It will add Y to these addresses, but Y equals 0 this first pass through the loop. Then, we INY (raise it by one). The three registers (A,X, and Y) can only count up to 255; after that, they reset themselves to 0. So, when Y = 1 after the INY, the BNE instruction will "fail" and we'll branch back to 49156 for the second pass through the loop. We can't get past BNE until Y resets itself to zero—BNE means Branch Not Equal (to 0). And Y isn't yet reset to 0.

But, notice what happens the second time through the loop. Since Y now equals 1, we'll be putting our 8 into 55297, 55553, and so on. This storage of 8's continues until all the locations between 55296 and 56319 have been filled.

The Most Common ML Bug

The second section of our game (lines 49171 through 49184) is quite similar and makes use of the same addressing mode. But here we're drawing a horizontal line across the top and bottom of the screen. So, since the screen is only 40 bytes wide, we'll have to test Y (line 49182) to see if it's equal to 40. If not, we BNE back and continue the loop. There are several "B" instructions; all of them begin with the letter B and branch somewhere (if

It's time for your computer to grow up.

Meet PractiCalc.™ The world's most versatile spreadsheet at only $40.*

Games are fun when it's time to play. But at heart, your Commodore 64™ or VIC-20™ is a full-grown computer straining to gallop at the touch of your fingers.

But the problem is, most software's been designed for toys. Not for real computers. Until now.

Commodore 64 and VIC-20. Not just for games...

Now comes PractiCalc. And there's not much in the world of grown-up computing it won't do. It'll keep addresses (in alphabetical or numerical order), phone numbers (likewise), make budgets and menus, project profits, keep track of expenses, inventories, investments, what have you. For your home, your school, your business.

Budgets, inventories, projections, you name it...

Spreadsheet analysis...

PractiCalc gives you everything you'd expect from a spreadsheet, like adding and subtracting, multiplying and dividing, calculating square roots, logarithms, exponential numbers and even trig functions. And PractiCalc gives you a lot more.

Want to make a chart? Hit a key and the high or low resolution graphics of PractiCalc Plus or PractiCalc 64 will turn numbers into graphs. It'll even print out everything that shows on the screen.

High or low resolution graphics...

Want a lot of facts and figures at your fingertips? PractiCalc stores more than 2,000 cells in up to 100 columns and 250 rows. It'll sort them, search them, or shuffle them for you.

High-speed and wild card search...

You can add entries, delete them, or move them around –numerically or alphabetically, and instantly, of course. And you'll find PractiCalc unusually friendly, flexible, and forgiving.

All of which is a far cry from just playing with a joystick. Still, PractiCalc has one thing in common with a computer game. The price. Only $40.

Alpha or numeric sort...

PRACTICALC™ by COMPUTER SOFTWARE ASSOCIATES, INC.

Exclusively distributed by **Micro Software International, Inc.**
The Silk Mill, 44 Oak Street, Newton Upper Falls, MA 02164 • (617) 527-7510

*$40 is suggested retail price for tape version of PractiCalc-20 ($45 for disk version; PractiCalc Plus or PractiCalc 64 = $50 for tape version, $55 for disk).

See us at CES Booth #6940

conditions pass their test). BEQ means Branch if EQual to 0. We'll get to the others in the future. BEQ and BNE, though, are by far the most commonly used ones.

The other instructions here are also the most frequently used ML commands. STA (STore the A register), LDA (LoaD the A register), STY, LDY, CPY (ComPare Y), INY (raise Y register by 1; literally INcrement Y), DEY (reduce Y by 1, literally DEcrement Y), and their companion instructions (DEX, INX, LDX, STX, CPX) all operate according to the same rules (and set up flags for the "B" instructions to test and then decide whether or not to branch).

One other thing to notice here: The computer will always assume that you are loading *from an address* unless you specify otherwise. If you write LDA 15, the computer copies whatever is in address 15 into the A register. (Whatever was at address 15 remains there; only a copy of it is placed into the A register.) So, if you want to actually put the *number 15* itself into the A register, you must put a number sign in front of it: LDA #15. As you can see, we do this frequently in our program. But beware—the single most common source of ML bugs is forgetting to put in that # when you mean a number as such, or putting it in when you mean to get a copy of a number from some memory location in the computer.

Sending Something C/O

Now on to the new portion of our ML game (lines 49186 to the end). Here we are going to draw vertical lines down the sides of the screen, completing the frame for our game. To do this, we'll need to POKE the first address of screen RAM memory, then POKE the 39th (the top of the right-hand margin), then the 40th (the second space down on the left margin), then the 79th, and so on down. The easiest way to do this in ML is to send a character to the right side of the frame, add 1 to Y (INY) and send the character again, this time to the left side of the screen. Then we must add 40 to our address (22 on the VIC) to get over to the right side again.

As before, we'll set up a loop, but we first have to prepare two bytes in zero page (the first 250 memory cells of the computer). These two bytes will hold our addresses in a special way. We'll change the contents of these bytes as we go along, adding 40 (or 22). You can visualize these special bytes in zero page as a Ping-Pong paddle and, by shifting its angle, you can send the balls low or high or anywhere in between.

Working In The Real World

Our 6502 chip can send things to 65536 memory cells, but how can we store a number that large when each cell will only hold numbers up to 255? It's simple enough: We gang two bytes together to hold large numbers. Take a number like 1024, the start of the 64's screen memory RAM. Divide it by 256 and you get 4. So put that in one of the two bytes holding our number (call it the *most significant byte*, or MSB). Then put the remainder of the division (0 in this case) into the other byte, the *least significant byte*, or LSB. Line them up in memory as LSB/MSB (it's backwards to us, but the computer likes them put in this way). There you have it. Notice that the Assembler program performs this whole task for you automatically when you type in a large address (as in line 49156).

How does this work in the real world? We do need to set up just such a double-byte address for our routine which draws vertical lines. We're going to use the two bytes at 71–72 (space that's not being used by the computer during an ML program run). Notice that we must use zero page for setting up our special c/o addressing method. We start off (line 49186) by putting 39 into the LSB, address 71. Then we put a 4 into 72, the MSB. Since the real address (the target) is 256 × LSB + MSB, we'll get 1063 as the target when we land on these two bytes. 1063 is the first space on the right-hand side of our vertical screen line. We can start there because the first line is already filled in anyway with our horizontal line, built earlier in the program.

At this point we can formally introduce one of the most significant and useful of the ML addressing modes—*Indirect Y*. (It's usually called *indirect indexed*. Who can remember that? Let's call it Indirect Y.) It takes a minute to get it straight, but it's a minute well spent. You'll find many uses for this handy method of sending bytes anywhere in the computer. When you address something this way, it "bounces off" the number you prepare in zero page, it's indirect, it's like sending a letter c/o someone. In effect, it gets readdressed once the computer lands down in zero page.

TELSTAR 64

Sophisticated Terminal Communications Cartridge for the 64.

PFO 10D 00D CP D1 D2 BELL 12:30:00 10:14:36
(TELSTAR's Status Line)

Don't settle for less than the best!

- Upload/Download to/from disk or tape.
- Automatic File Translation.
- Communicates in Industry Standard ASCII.
- Real-Time Clock plus Alarm Clock.
- Line editing capability allows correcting and resending long command lines.
- 9 Quick Read functions.
- Menu-driven.
- Similar to our famous STCP Terminal package.
- Works with Commodore Modems and supports auto-dialing.

The best feature is the price — **only $49.95** (Cartridge and Manual)

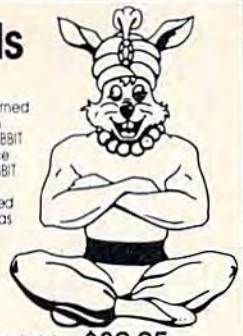
Machine Language Monitor Cartridge
for the CBM 64

More than 20 commands allow you to access the CBM 64's Microprocessors Registers and Memory Contents. Commands include assemble, disassemble, registers, memory, transfer, compare, plus many more.

Someday every CBM 64 owner will need a monitor such as this.

Cartridge and Manual — **$24.95**

8K in 30 Seconds
for your VIC 20 or CBM 64



If you own a VIC 20 or a CBM 64 and have been concerned about the high cost of a disk to store your programs on worry yourself no longer. Now there's the RABBIT. The RABBIT comes in a cartridge, and at a much, much lower price than the average disk. And speed ... this is one fast RABBIT. With the RABBIT you can load and store on your CBM datasette an 8K program in almost 30 seconds, compared to the current 3 minutes of a VIC 20 or CBM 64, almost as fast as the 1541 disk drive.

The RABBIT is easy to install, allows one to Append Basic Programs, works with or without Expansion Memory, and provides two data file modes. The RABBIT is not only fast but reliable.

(The Rabbit for the VIC 20 contains an expansion connector so you can simultaneously use your memory board, etc.)

$39.95

MAE NOW THE BEST FOR LESS!
$59.95

For CBM 64, PET, APPLE, and ATARI

Now, you can have the same professionally designed Macro Assembler/Editor as used on Space Shuttle projects.

- Designed to improve Programmer Productivity
- Similar syntax and commands – No need to relearn peculiar syntaxes and commands when you go from PET to APPLE to ATARI
- Coresident Assembler/Editor – No need to load the Editor, then the Assembler, then the Editor, etc.
- Also includes Word Processor, Relocating Loader, and much more
- Powerful Editor: Macros, Conditional and Interactive Assembly, and Auto – zero page addressing

Still not convinced, send for our free spec sheet!

49224  RTS
```

After we load Y (our offset) with 0 again and load A with the framing character (224), we can store the 224 into the address which the computer finds by looking at the double-byte number we put into addresses 71–72. When it sees STA (71),Y—the computer knows what to do. It first calculates the correct target formed by multiplying whatever it finds in cell 72 × 256 and then adding whatever's in cell 71. Then, it also adds the value of the Y register.

So, we can manipulate the number in Y here the same way that we used it with Absolute Indexed above (line 49156), but have the added advantage of being able to manipulate the double-byte address at 71–72 as well. The first time through this loop, the framing character will be sent to 1063. Then we INY and send another framing character to 1064 (the second space down the left side of the screen). Then we DEX. X is counting down from 24 because there are 24 spaces down each side of the screen that we need to fill. If the DEX causes X to equal 0, then the BEQ takes effect and sends us back to BASIC mode via the RTS (ReTurn from Subroutine) at line 49224. If X is not yet zero (and thus we want to continue the looping), we will add 40 to the double-byte number at 71–72.

The adding is done by first clearing the carry, CLC, and then putting the number from 71 into the A register, adding 40 (ADC means ADd with Carry) and then storing the result back into cell 71. Likewise, we get the number from 72, add it to 0, and put it back. Why add to 0? Because there might be a carry from the operation on the number in 71. If so, we need to reflect that in the overall number by adding it to the MSB (in cell 72). After we've added 40 to this special double-byte number, we just jump (JMP) back to the line where we start our loop that prints the framing characters to the screen.

We've covered a good bit of ground this month. You should try out these routines with your Assembler and run them after they've been placed into memory: SYS 12288 (VIC) or SYS 49152 (64). Then, change some of the numbers and see the effects. Try using a different character for the frame. Pay particular attention to the way that Indirect Y addressing accomplishes its effects—we'll be using it frequently from here on.

See program listings on page 201.

80 COLUMNS! 25 LINES

A FULL PROFESSIONAL DISPLAY FOR

Commodore 64 with Screenmaker™

Screenmaker is a video display generator module that plugs into the expansion connector of the Commodore 64.

- ✓ WORD PROCESSING
- ✓ CALCULATIONS
- ✓ BASIC PROGRAMS

Screenmaker provides a B & W video signal that connects to your video monitor to provide a full 80 characters on each line. With Screenmaker, Screen displays will appear the same as the printer output. Trial printouts can be eliminated. Word processing is easier. Forms and reports can be set up faster. Screenmaker features a bank switched memory, 40/80 video switch, and a full character set including graphics.

64 BASIC Aid

Harold D. Vanderpool

This extremely useful utility program adds four commands to BASIC and belongs in every programmer's toolbox. The utility itself is written in machine language. To type it in, use the MLX entry program found elsewhere in this issue.

No version of BASIC has everything. No matter what computer you look at, there are things that could be added to customize it for your particular needs. The VIC and 64 have an excellent version of BASIC, Microsoft, which has been popular for years on microcomputers. But if you do a bit of programming, you might find that "64 BASIC Aid" will be among the most valuable utility programs in your library—it adds four extremely useful commands to the 64's BASIC.

It uses up very little of your RAM memory (about 1000 bytes) and after you've typed in and saved a copy, you can use 64 BASIC Aid anytime you want those extra four commands. You LOAD it and RUN it as you would any other program, but it hides itself high up in memory and becomes invisible. You can then program as always, but you've got those four extra commands available to you.

Since these commands are useful for writing and debugging programs, they are available to you only in *direct* mode. (You can't include them in a program itself, but you'd never have reason to use them that way.)

Four Programming Aids

NUMBER 100,10. With this command, you can renumber any program that's in your computer. Just type the command and press RETURN. The new version of the program will start with line 100 and go up from there in steps of ten. You can use any numbers you want as the starting line number and any number from 1 to 255 as the step size. This can be useful in several ways. For example, you might have used up all the line numbers somewhere in your program: you've got lines 25, 26, 27, 28, 29, and so forth. No room for new numbers to insert a line? Just use NUMBER and they'll be spread apart instantly for you.

Within your program, there probably will be GOSUBs or GOTOs or other references to existing line numbers. 64 BASIC Aid takes care of that, adjusting the references automatically. However, if it finds a GOTO that's targeted to a line that doesn't exist in the program, it will print the number 65535 on the screen. This is helpful when you debug your programs. Also, all adjusted lines will be printed on the screen.

DELETE 100–200. When you type this, all the lines between 100 and 200 (inclusive) will disappear from your program. It works the same way that the LIST command works, using the same format. But be careful with this one. If you just type DELETE without any line numbers after it and then hit RETURN, it will delete the whole program.

FIND/GOTO/,500–900. This would print a list on screen of each line between 500 and 900 which contained a GOTO command. Again, you can indicate how you want the line numbers handled in the same way, using the same options, as with the ordinary LIST command. If you want a

EDUCATIONAL GAMES

- ***Designed by Experienced Educators***
- ***Programmed in Machine Language***
- ***Fast & Smooth Action, Maximum Graphics & Sound***

Each of our educational programs targets a specific learning need, begins with step-by-step interactive learning activities, and ends with a reinforcing game. Our educational software advances the gifted child and motivates the underachiever.

☐ **METRIC FEVER**—Makes it fun to learn the metric conversions of linear, capacity and weight or mass measurements.

☐ **SEARCHER OF THE SOLAR SYSTEM**—Teaches meanings of astronomical terms, order of the inner and outer planets and satellites, many planetary facts.

☐ **RACEWAY U.S.A.**—Identifies each state by shape & name, locates capitals, teaches state nicknames and important points of interest.

☐ **MATH MANIA**—Designed with different levels of mastery for addition, subtraction, multiplication & division; many unique games (drills).

☐ **Send me your free Color Brochure.**

NAME _____

ADDRESS _____

CITY _____ STATE _____ ZIP _____

report on the whole program, just leave off the comma and the line numbers. You can search for anything: variables, strings, commands, numbers. One note, however, about looking for things in quotes. The computer won't know if you want the *word* "to" or the *BASIC command* TO unless you use quotation marks instead of the slashes when you're looking for words as literal words. So, to find the word "to" you'd type:

```
FIND"TO",500-900
```

CHANGE@PRINT@PRINT#4 @,300–400. Similar to FIND, CHANGE will both locate and *replace* all occurrences of something within your program. All the rules for FIND apply the same way to CHANGE. The example here could be very useful if you have a printer. As written, your program is designed to PRINT everything to the screen. But you can make everything go to the printer instead by adding a line at the start of the program, OPEN 4,4 which alerts the computer that a channel has been opened to the printer. Then this CHANGE will make all printing go to channel 4 (Commodore printers are always Device #4, by convention) instead of the screen.

Another use for CHANGE would become apparent if you'd written a large program and used an illegal variable name like TI (reserved for the clock) or TO (a command name). Instead of hunting through the program, trying to find each illegal variable, just SAVE the program, LOAD and RUN 64 BASIC Aid, LOAD the program back in, and type: CHANGE/TI/TR/ and it's fixed in a flash. Like FIND, the whole program is changed if you leave off the line number information.

KILL turns off 64 BASIC Aid. If you want the computer to be returned to its original state, just type KILL and everything will be as if you'd just turned it on.

Here's the information you need to type in 64 BASIC Aid with the special MLX machine language entry program found elsewhere in this issue:

Start address = 39852
End address = 40961

To activate 64 BASIC Aid once it's loaded, enter SYS 39852.

If you don't want to type this program, send $3, a blank cassette or 1541/4040 disk, and a self-addressed, stamped mailer to:

Harold D. Vanderpool
3705 Enon Xenia Pike
Enon, OH 45323

See program listing on page 203.

Bug-Swatter:
Modifications And Corrections

● Two changes are necessary in the 64 version of "Oil Tycoon" (October). Add the following lines to pick a difficulty level or to press E to end the game:

```
230 PRINT"{DOWN} DIFFICULTY LEVEL? 123456
    78E(END){GRN}":T=1                :rem 76
235 POKE56194+T,0:T1=T:T=T+(PEEK(JS)AND4)
    /4-(PEEK(JS)AND8)/8:IF T>9 THEN T=1
                                      :rem 157
237 IF T<1 THENT=9                    :rem 229
263 IF T=9 THEN SYS2048               :rem 240
```

When converting the VIC version to the 64, we also neglected to include the feature which allows you to replace the oil rig by pressing the fire button. Add these lines:

```
435 Q=R-1:IF Q=0 THEN 360             :rem 41
437 J=Z:FORA=0TO21:A%(A)=0:NEXT:B=Q*40+W+
    X:A=PEEK(B):IF A<>7 THEN 480 :rem 255
```

● The text-adventure game "Martian Prisoner" (November) does not respond properly when you attempt to hit a Martian guard. This bug escaped our testing because we found it safer to fool the guards rather than provoke them (hint). Nevertheless, if you want to hit the guards, insert a GOSUB command in line 125:

```
125 IFV=14 THEN GOSUB 3900        :rem 154
```

● Many of you who typed in the VIC version of "Aardvark Attack" (October) encountered a syntax error in line 55. The reason is that the programmer used a keyword abbreviation when he wrote the line, and it works fine when typed in with the abbreviation. That's why our testing detected no errors. Unfortunately, listings do not show abbreviations. Here is the line:

```
55 M=(TANDFNM(J))/4 J....          :rem 77
```

The computer interprets T AND FNM(J) as TAN (tangent) without a value. There are four ways to fix it: (1) insert a space between T and AND; (2) abbreviate AND with A-SHIFT-N; (3) put the T in parentheses; (4) reverse the order—FNM(J)ANDT.

● The 64 version of "Munchmath" (November) does not accept answers beginning with 9. To fix this, remove ORAN$>"9" from line 200.

● In November's "Machine Language For Beginners" column, the VIC version of "The Assembler" program requires an 8K memory expander.

LIST Freezer

Doug Ferguson

This very short routine will prove indispensable to BASIC programmers—it allows you to pause or freeze a LISTing of the program on the screen. The routine is a machine language program presented in the form of a BASIC loader, so you need to know nothing about machine language to use it. What's more, it works equally well on the Commodore 64 or VIC-20.

The VIC-20 and Commodore 64 cry out for a pause feature during a LIST. When you're writing or debugging a program, especially if you lack a printer, you can waste a lot of time typing LIST again and again just to get a look at your BASIC code.

"LIST Freezer" is an elegant solution to the problem. It patches directly into the LIST routine in ROM (Read Only Memory) without interfering with anything else. Once it's activated, there is never any need to turn it off. It also eliminates the screen ripple effect of some other LIST pause routines, including one I published in COMPUTE! Magazine in 1982.

The LIST Freezer

The program below activates the pause feature for either the VIC or 64. Type it in exactly, SAVE it, RUN it, LOAD something in BASIC, and give it a try. (Because it destroys the BASIC loader part of itself in line 80, be sure to SAVE it before typing RUN for the first time.)

To use LIST Freezer, LIST any BASIC program and hold down the SHIFT key. The listing will pause. To freeze it entirely while freeing your hands, press SHIFT LOCK. You can restart the listing at any time by releasing SHIFT or SHIFT LOCK.

Technical Details

For the curious, here's how it works. Line 20 sets the low-byte/high-byte address of a machine language "patch" at the top of RAM (Random Access Memory). The patch consumes 23 bytes of memory on either the VIC or 64.

Line 30 redefines the computer's memory size to protect the patch. It also moves the LIST vector at memory addresses 774–775 (hexadecimal $0306–$0307) to reroute the indirect jump to ROM (address $A717 in the 64 or $C717 in the VIC).

The remaining lines create the patch routine at the top of RAM. Line 50 adjusts the patch to work on either the VIC or 64.

Notice that the program assumes the normal LIST vector at power-up; line 20 thus prevents you from accidentally trying to activate the routine more than once while the power is on.

Also note that the routine clears out the keyboard buffer when activated. Actually this was necessary only for the VIC, but it causes no harm on the 64 and was left in to make the routine universal.

LIST Freezer

```
20 L=232:H=PEEK(56)-1:Q=PEEK(775):IF Q<16
   7 THEN 80                          :rem 236

Centering VIC Screens

Mary Conlin

If you've discovered a clever time-saving technique, or a brief but effective programming shortcut, send it in to "Hints & Tips," c/o COMPUTE!'s GAZETTE for Commodore. If we use it, we'll pay you $35.

Some VIC-20s and TV sets don't match up perfectly — the screen image appears to be a little off-center. This is called *overscan*. If you can't compensate by fiddling with the TV controls — or if you prefer to leave the TV controls as they are for regular TV viewing — there's a way to adjust the screen from the computer.

Two memory locations inside the VIC control the horizontal and vertical positions of the screen image. By using simple POKE statements in direct mode or within a program, you can quickly adjust the screen for any TV. This method works on a VIC of any memory size. You can restore the screen to its normal position at any time by holding down the RUN/STOP key and pressing RESTORE.

(The Commodore 64 lacks these adjustments, but has much less need for them because its screen image is smaller than the VIC's and is less subject to overscan.)

Horizontal Adjustments

The horizontal screen position is controlled by memory location 36880. Normally this location contains a 5. POKEing smaller numbers into this location moves the screen left, and POKEing larger numbers moves it right. For example, to move the screen one position left, type:

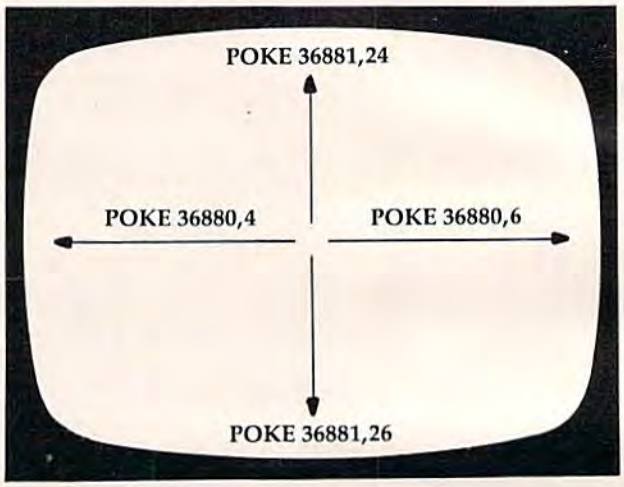
POKE 36880,4 [press RETURN]

Or, to adjust the screen one position right, type:

POKE 36880,6 [press RETURN]

If your screen is off-center by more than one position, try POKEing a 3 or a 7, etc. Once you find the correct value for your particular computer/TV combination, you can include the statement at the beginning of all your BASIC programs so the adjustment is made automatically whenever you type RUN.

Centering VIC Screens On A TV



Vertical Adjustments

The vertical screen position is controlled by memory location 36881. Normally this location contains a 25. POKEing smaller numbers into this location moves the screen up, and POKEing larger numbers moves it down. For example, to move the screen one position up, type:

POKE 36881,24 [press RETURN]

Or, to move the screen one position down, type:

POKE 36881,26 [press RETURN]

Using numbers too high can move the screen completely out of view. If this happens, simply POKE back the 25 or press RUN/STOP-RESTORE. Again, once you find the best number, you can include this statement in all your BASIC programs.

NEWS & PRODUCTS

VIC-20 Spreadsheet

Computer Software Associates has released a VIC-20 version of PractiCalc Plus, a combination spreadsheet-data base manager program.

The program, available on tape or disk, requires a 16K RAM card expander.

PractiCalc Plus allows full use of mathematical and trigonometric function, incorporates search and sort routines, and has a single-key histogram function. The program, which sells for $49.95 on tape and $54.95 on disk, can be used for budget and business projections, expense tracking, investments, and inventory.

The Silk Mill
44 Oak Street
Newton Upper Falls, MA 02164
(617) 527-7510

Space Game For VIC

Ridge Runner is a machine-language space game for the unexpanded VIC-20.

In the game, produced by Bytes and Bits, you maneuver your multicolor ship through a minefield and a volley from enemy ships.

The game, which requires a joystick and sells for $14.95, includes a horizontally scrolling playfield, multicolor graphics, sound, a high-score recorder, and a pause option.

Bytes and Bits
524 East Canterbury Lane
Phoenix, AZ 85022

Commodore 64 Rescue, VIC-20 Educational Games

Zeppelin Rescue, a game of coordination and skill for the Commodore 64, and several educational games for the VIC-20 are available from Micro Software International.

In *Zeppelin Rescue*, you must overcome the forces of gravity and the slow, cumbersome controls of your airship to rescue the inhabitants of a threatened city. The game includes five cityscapes and four levels—daylight, dusk, night, and dawn.

The program is available on disk for $24.95, or on cassette for $19.95.

The VIC-20 programs are all available on cassette and require no memory expansion. They include *Math Duel*, a basic number skills program for students in grades 1 through 6; *Tiny Tutor*, a simple math problem tutorial for children ages 2 through 7; *VIC Sketch*, a drawing program with SAVE and PRINT features; and *Composer*, which teaches the rudiments of music.

Math Duel and *Tiny Tutor* sell for $19.95. *VIC Sketch* and *Composer* are $14.95 each.

Micro Software International

One-Handed Bridge

Computer Management Corporation has released *BridgePro*, a program that will allow one person and a Commodore 64 to enjoy a game of bridge.

The program, which is written in machine language, takes care of the shuffling and dealing, and will bid and play three hands.

The program allows replaying hands, prevents illegal bids, and offers a help screen on bidding for bridge newcomers. A game for two players is among *BridgePro*'s other options.

BridgePro is available on disk for $35.

Help For Programmers

A collection of worksheets, programming aids, grid-sheets, and logs, designed to help simplify VIC-20 and Commodore 64 programming, is available from PM Products.

Programmer's Aids and Logs includes a guide to all keys, POKEs, CHR$ codes, and characters; sound and music worksheets; a condensed BASIC dictionary; grids for screen layout, custom characters, and sprites; and documentation worksheets for variable, subroutine, and file use.

Also included are cutout function key templates and a BASIC-Aid reference card. The package, which sells for $9.95, contains 95 color-coded pages and is punched for use in three-ring binders.

PM Products
4455 Torrance Blvd., #177
Torrance, CA 90503

Programmer's Aids and Logs is a collection of worksheets, reference cards, and programming aids for the VIC or 64.

Tax Preparation Programs

Northland Accounting has produced three tax preparation programs for the Commodore 64 and VIC-20. The programs produce a line-by-line readout of IRS Form 1040 and related schedules. Updates for new tax years will be published annually.

Taxaid I is for the unexpanded VIC-20. The program directs its output to the monitor. *Taxaid II* is for a VIC-20 with 16K. Output can be directed to the monitor or a printer. *Taxaid III* is for the Commodore 64, with output directed to the monitor or printer.

Taxaid I is available on tape for $19.95 or on disk for $24.95. The other two versions are available on tape for $24.95 or on disk for $29.95.

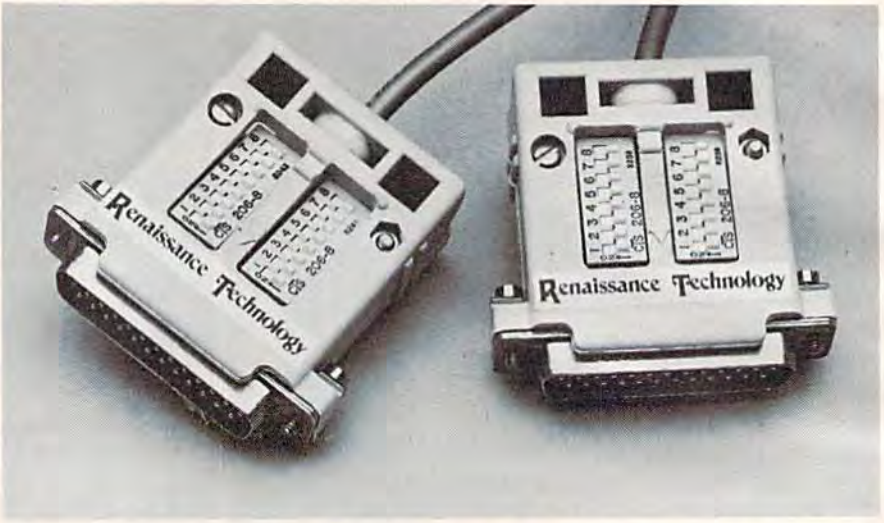
Universal Serial Cable

Renaissance Technology has produced the Universal Serial Cable, which simplifies connections between RS-232 serial computers and peripheral devices.

Built into the cable connectors are sets of DIP switches that can be set according to the requirements of the devices being connected. A cross-reference chart of switch settings is included with the cable.

The Universal Serial Cable sells for $62.

Renaissance Technology Corp.
1070 Shary Circle
Concord, CA 94518
(415) 676-5757



The Universal Serial Cable from Renaissance includes DIP switches in the connectors to eliminate the need for specially wired cables.

Activity-Planning Software

SEI Enterprises has produced a series of programs designed to help groups of users plan their activities.

The programs, which cover vacation, menu, and spending plans, allow up to ten participants to enter their preferences into the computer. Each person is then given a chance to vote on the suggestions made, and the program tallies the results and generates a printout.

The initial series is $24.95 and consists of four programs. They are *Acti-Trip*, for trip planning; *Acti-Spend*, for spending priorities; *Acti-Menu*, for meal planning; and *Acti-Play*, designed for youngsters to determine how to spend their free time.

The programs are available for the Commodore 64 and the VIC-20 with 8K expansion.

SEI Enterprises
17 Serpi Road
Highland Mills, NY 10930

Word Processor For Commodore 64

Easy Script 64, a word processing program from Commodore Software, is available for the Commodore 64.

Features of the program include selectable display colors; hunt and find; search and replace; function key editing; superscripts and subscripts; vertical and horizontal tabs; and the ability to transfer words, phrases and blocks within text. The program includes a form-letter command, and it offers optional sound effect prompts.

Easy Script 64, which sells for $49.95, also is compatible with *Easy Spell 64*, Commodore's spelling checker.

West Chester, PA 19380
(215) 431-9100

VIC Memory Poster

Kevco has produced *Inside the VIC-20*, a 27 by 21-inch color poster that shows the important memory locations in the VIC.

The chart includes information on the BASIC memory map, video screens, sound and color, as well as data on paddles, joysticks and light pens.

The poster, which makes often-used information avail-

able at a glance, sells for $6.95. A Commodore 64 version is forthcoming.

Kevco Electronic and Software Engineering
480 Georgia Court
Claremont, CA 91711
(714) 626-4148

Investment Manager

Portfolio Manager is an investment management program for the Commodore 64 or 16K VIC-20 computers.

The program, which is the first in a series of personal finance programs planned by Basic Byte, allows the user to easily record and compute stock transactions. *Portfolio Manager* sells for $29.95.

Basic Byte, Inc.
13108 Ludlow
Huntington Woods, MI 48070
(313) 545-6779

Property Management System

MicroSpec has introduced its *Rental Property Manager* program for the Commodore 64.

With the program, a landlord can keep track of up to 200 rental units per diskette. The program maintains 18 fields per record, including information on the property owner, the tenant, the rent payment record, and the availability of the unit.

The system, which requires one disk drive, can produce a variety of reports including tenant lists, overdue rent lists, expired lease lists, vacancy lists, and income and expense reports.

Rental Property Manager sells for $179.95.

MicroSpec, Inc.
Box 836085
Plano, TX 75086
(214) 867-1333

Educational Games For Commodore 64

Bertamax has reached agreement with Commodore Business Machines to convert 21 educational programs for use on the Commodore 64.

Among the programs being converted are several programs designed for children in kindergarten through third grade. The titles include *Number Match It, Addition Match, Subtraction Match, Multiplication Match, Division Match*, and six reading programs in the *Story Mix* series.

Other programs covered in the agreement are: *Spelling in Context*, a 308-lesson program available for grade levels one through eight; *Math Facts Games—Set 2*, a series of four two-player math games; and *Number Cruncher*, 30 lessons in math and problem-solving skills.

Bertamax, Inc.
3647 Stoneway North
Seattle, WA 98103
(206) 547-4056

Spreadsheet For VIC And 64

ESP›Calc is an electronic spreadsheet planning calculator for both the VIC and 64.

The same program runs on both computers, and the size of the spreadsheet is limited only by computer memory. The manual includes step-by-step instructions to help novice spreadsheet users become accustomed to the program.

ESP›Calc is designed to handle things like household budgets, heat and electric use, stock portfolios, and rental property analysis. The program also includes printer options.

The cassette version of *ESP›Calc* sells for $43.50; the disk version is $47.50.

Belleville, IL 62223

COMPUTE!'s GAZETTE *welcomes announcements of new products for VIC-20 and Commodore 64 computers, especially products aimed at beginning to intermediate users. Please send press releases and photos well in advance to: Tony Roberts, Assistant Managing Editor,* COMPUTE!'s GAZETTE, *P.O. Box 5406, Greensboro, NC 27403.*

New product releases are selected from submissions for reasons of timeliness, available space, and general interest to our readers. We regret that we are unable to select all new product submissions for publication. Readers should be aware that we present here some edited version of material submitted by vendors and are unable to vouch for its accuracy at time of publication.

How To Type In *COMPUTE!'s Gazette* Programs

Many of the programs which are listed in *COMPUTE!'s Gazette* contain special control characters (cursor control, color keys, inverse video, etc.). To make it easy to know exactly what to type when entering one of these programs into your computer, we have established the following listing conventions.

Generally, any VIC-20 or Commodore 64 program listings will contain bracketed words which spell out any special characters: {DOWN} would mean to press the cursor down key. {5 SPACES} would mean to press the space bar five times.

To indicate that a key should be *shifted* (hold down the SHIFT key while pressing the other key), the key would be underlined in our listings. For example, S would mean to type the S key while holding the shift key. This would appear on your screen as a "heart" symbol. If you find an underlined key enclosed in braces (e.g., {10 N}), you should type the key as many times as indicated (in our example, you would enter ten shifted N's).

If a key is enclosed in special brackets, ⟨⟩, you should hold down the *Commodore key* while pressing the key inside the special brackets. (The Commodore key is the key in the lower left corner of the keyboard.) Again, if the key is preceded by a number, you should press the key as many times as necessary.

Rarely, you'll see a solitary letter of the alphabet enclosed in braces. These characters can be entered on the Commodore 64 by holding down the CTRL key while typing the letter in the braces. For example, {A} would indicate that you should press CTRL-A. You should never have to enter such a character on the VIC-20, but if you do, you would have to leave the quote mode (press RETURN and cursor back up to the position where the control character should go), press CTRL-9 (RVS ON), the letter in braces, and then CTRL-0 (RVS OFF).

About the *quote mode*: you know that you can move the cursor around the screen with the CRSR keys. Sometimes a programmer will want to move the cursor under program control. That's why you see all the {LEFT}'s, {HOME}'s, and {BLU}'s in our programs. The only way the computer can tell the difference between direct and programmed cursor control is the quote mode.

Once you press the quote (the double quote, SHIFT-2), you are in the quote mode. If you type something and then try to change it by moving the cursor left, you'll only get a bunch of reverse-video lines. These are the symbols for cursor left. The only editing key that isn't programmable is the DEL key; you can still use DEL to back up and edit the line. Once you type another quote, you are out of quote mode.

You also go into quote mode when you INSerT spaces into a line. In any case, the easiest way to get out of quote mode is to just press RETURN. You'll then be out of quote mode and you can cursor up to the mistyped line and fix it.

Use the following table when entering cursor and color control keys:

When You Read:	Press:	See:
{CLEAR}	SHIFT + CLR/HOME	
{HOME}	CLR/HOME	
{UP}	SHIFT + CRSR ↑	
{DOWN}	CRSR ↓	
{LEFT}	SHIFT + CRSR ←	
{RIGHT}	CRSR →	
{RVS}	CTRL + 9	
{OFF}	CTRL + 0	
{BLK}	CTRL + 1	
{WHT}	CTRL + 2	
{RED}	CTRL + 3	
{CYN}	CTRL + 4	
{PUR}	CTRL + 5	
{GRN}	CTRL + 6	
{BLU}	CTRL + 7	
{YEL}	CTRL + 8	
⟨1⟩	f1	
⟨2⟩	f2

{F8}	f8	

A Beginner's Guide To Typing In Programs

What Is A Program?

A computer cannot perform any task by itself. Like a car without gas, a computer has *potential*, but without a program, it isn't going anywhere. Most of the programs published in *COMPUTE!'s Gazette* for Commodore are written in a computer language called BASIC. BASIC is easy to learn and is built into all VIC-20s and Commodore 64s.

BASIC Programs

Each month, *COMPUTE!'s Gazette* for Commodore publishes programs for both the VIC and 64. To start out, type in only programs written for your machine, e.g., "VIC Version" if you have a VIC-20. Later, when you gain experience with your computer's BASIC, you can try typing in and converting certain programs from another computer to yours.

Computers can be picky. Unlike the English language, which is full of ambiguities, BASIC usually has only one "right way" of stating something. Every letter, character, or number is significant. A common mistake is substituting a letter such as "O" for the numeral "0", a lowercase "l" for the numeral "1", or an uppercase "B" for the numeral "8". Also, you must enter all punctuation such as colons and commas just as they appear in the magazine. Spacing can be important. To be safe, type in the listings *exactly* as they appear.

Brackets And Special Characters

The exception to this typing rule is when you see the curved bracket, such as "{DOWN}". Anything within a set of brackets is a special character or characters that cannot easily be listed on a printer. When you come across such a special statement, refer to "How To Type In *COMPUTE!'s Gazette* Programs."

About DATA Statements

Some programs contain a section or sections of DATA statements. These lines provide information needed by the program. Some DATA statements contain actual programs (called machine language); others contain graphics codes. These lines are especially sensitive to errors.

If a single number in any one DATA statement is mistyped, your machine could "lock up," or "crash." The keyboard and STOP key may seem "dead," and the screen may go blank. Don't panic – no damage is done. To regain control, you have to turn off your computer, then turn it back on. This will erase whatever program was in memory, *so always SAVE a copy of your program before you RUN it*. If your computer crashes, you can LOAD the program and look for your mistake.

Sometimes a mistyped DATA statement will cause an error message when the program is RUN. The error message may refer to the program line that READs the data. *The error is still in the DATA statements, though.*

Get To Know Your Machine

You should familiarize yourself with your computer before attempting to type in a program. Learn the statements you use to store and retrieve programs from tape or disk. You'll want to save a copy of your program, so that you won't have to type it in every time you want to use it. Learn to use your machine's editing functions. How do you change a line if you made a mistake? You can always retype the line, but you at least need to know how to backspace. Do you know how to enter inverse video, lowercase, and control characters? It's all explained in your computer's manuals.

A Quick Review

1) Type in the program a line at a time, in order. Press RETURN at the end of each line. Use backspace or the back arrow to correct mistakes.

2) Check the line you've typed against the line in the magazine. You can check the entire program again if you get an error when you RUN the program.

3) Make sure you've entered statements in brackets as the appropriate control key (see "How To Type *COMPUTE!'s Gazette* Programs" elsewhere in the magazine.)

We regret that we are not able to respond to individual inquiries about programs, products, or services appearing in COMPUTE!'s Gazette *for Commodore due to increasing publication activity. On those infrequent occasions when a published program contains a typo, the correction will appear in the magazine, usually within eight weeks. If you have specific questions about items or programs which you've seen in* COMPUTE!'s Gazette *for Commodore, please send them to Gazette Feedback, P.O. Box 5406, Greensboro, NC 27403.*

The Automatic Proofreader

"The Automatic Proofreader" will help you type in program listings from COMPUTE!'s Gazette without typing mistakes. It is a short error-checking program that hides itself in memory. When activated, it lets you know immediately after typing a line from a program listing if you have made a mistake. Please read these instructions carefully before typing any programs in COMPUTE!'s Gazette.

Preparing The Proofreader

1. Using the listing below, type in the Proofreader. The same program works on both the VIC-20 and Commodore 64. Be very careful when entering the DATA statements — don't type an l instead of a 1, an O instead of a 0, extra commas, etc.

2. SAVE the Proofreader on tape or disk at least twice *before running it for the first time*. This is very important because the Proofreader erases this part of itself when you first type RUN.

3. After the Proofreader is SAVEd, type RUN. It will check itself for typing errors in the DATA statements and warn you if there's a mistake. Correct any errors and SAVE the corrected version. Keep a copy in a safe place — you'll need it again and again, every time you enter a program from COMPUTE!'s Gazette.

4. When a correct version of the Proofreader is RUN, it activates itself. You are now ready to enter a program listing. If you press RUN/STOP-RESTORE, the Proofreader is disabled. To reactivate it, just type the command SYS 886 and press RETURN.

Using The Proofreader

All VIC and 64 listings in COMPUTE!'s Gazette now have a *checksum number* appended to the end of each line, for example ":rem 123". *Don't enter this statement when typing in a program.* It is just for your information. The rem makes the number harmless if someone does type it in. It will, however, use up memory if you enter it, and it will confuse the Proofreader, even if you entered the rest of the line correctly.

When you type in a line from a program listing and press RETURN, the Proofreader displays a number at the top of your screen. *This checksum number must match the checksum number in the printed listing.* If it doesn't, it means you typed the line differently than the way it is listed. Immediately recheck your typing. Remember, don't type the rem statement with the checksum number; it is published only so you can check it against the number which appears on your screen.

The Proofreader is not picky with spaces. It will not notice extra spaces or missing ones. This is for your convenience, since spacing is generally not important. But occasionally proper spacing *is* important, so be extra careful with spaces, since the Proofreader will catch practically everything else that can go wrong.

There's another thing to watch out for: if you enter the line by using abbreviations for commands, the checksum will not match up. But there is a way to make the Proofreader check it. After entering the line, LIST it. This eliminates the abbreviations. Then move the cursor up to the line and press RETURN. It should now match the checksum. You can check whole groups of lines this way.

Special Tape SAVE Instructions

When you're done typing a listing, you must disable the Proofreader before SAVEing the program on tape. Disable the Proofreader by pressing RUN/STOP-RESTORE (hold down the RUN/STOP key and sharply hit the RESTORE key). This procedure is not necessary for disk SAVEs, *but you must disable the Proofreader this way before a tape SAVE.*

SAVE to tape erases the Proofreader from memory, so you'll have to LOAD and RUN it again if you want to type another listing. SAVE to disk does not erase the Proofreader.

Replace Original Proofreader

If you typed in the original version of the Proofreader (October 1983 issue), you should replace it with the improved version below. We added a POKE to the original version to protect it from being erased when you LOAD another program from tape. The POKE does protect the Proofreader, and the Proofreader itself was not affected. However, a quirk in the VIC-20's operating system means that programs typed in with the Proofreader and SAVEd on tape cannot be LOADed properly later. If you LOAD a program SAVEd while the Proofreader was in memory, you see ?LOAD ERROR. This applies only to VIC tape SAVEs (disk SAVEs work OK, and the quirk was fixed in the Commodore 64).

If you have a program typed in with the original Proofreader and SAVEd on tape, follow this special LOAD procedure:

1. Turn the power off, then on.
2. LOAD the program from tape (disregard the ?LOAD ERROR).
3. Enter: POKE 45,PEEK(174):POKE 46,PEEK(175):CLR
4. ReSAVE the program to tape.

The program will LOAD fine in the future. We strongly recommend that you type in the new version of the Proofreader and discard the old one.

MLX Machine Language Entry Program

For Commodore 64 And VIC-20

Charles Brannon, Program Editor

MLX is a labor-saving utility that allows almost failsafe entry of machine language programs published in COMPUTE!'s GAZETTE. You need to know nothing about machine language to use MLX—it was designed for everyone. There are separate versions for the Commodore 64 and expanded VIC-20 (at least 8K). MLX was conceived and written by Program Editor Charles Brannon. Important: MLX is required to type in the machine language programs in this issue.

MLX is a new way to enter long machine language (ML) programs with a minimum of fuss. MLX lets you enter the numbers from a special list that looks similar to BASIC DATA statements. It checks your typing on a line-by-line basis. It won't let you enter illegal characters when you should be typing numbers. It won't let you enter numbers greater than 255 (forbidden in ML). It won't let you enter the wrong numbers on the wrong line. In addition, MLX creates a ready-to-use tape or disk file. You can then use the LOAD command to read the program into the computer, as with any program:

```
LOAD "filename",1,1   (for tape)
LOAD "filename",8,1   (for disk)
```

To start the program, you enter a SYS command that transfers control from BASIC to machine language. The starting SYS number always appears in the appropriate article.

Using MLX

Type in and save the correct version of MLX for your computer (you'll want to use it in the future). When you're ready to type in an ML program, run MLX. MLX asks you for two numbers: the starting address and the ending address. These numbers are given in the article accompanying the ML program.

You'll see a prompt corresponding to the starting address. The prompt is the current line you are entering from the listing. It increases by six each time you enter a line. That's because each line has seven numbers—six actual data numbers plus a *checksum number*. The checksum verifies that you typed the previous six numbers correctly. If you enter any of the six numbers wrong, or enter the checksum wrong, the computer rings a buzzer and prompts you to reenter the line. If you enter it correctly, a bell tone sounds and you continue to the next line.

MLX accepts only numbers as input. It you make a typing error, press the INST/DEL key; the entire number is deleted. You can press it as many times as necessary back to the start of the line. If you enter three-digit numbers as listed, the computer automatically prints the comma and goes on to accept the next number. If you enter less than three digits, you can press either the comma, SPACE bar, or RETURN key to advance to the next number. The checksum automatically appears in inverse video for emphasis.

MLX Commands

When you finish typing an ML listing (assuming you type it all in one session) you can then save the completed program on tape or disk. Follow the screen instructions. If you get any errors while saving, you probably have a bad disk, or the disk is full, or you've made a typo when entering the MLX program itself.

You don't have to enter the whole ML program in one sitting. MLX lets you enter as much as you want, save it, and then reload the file from tape or disk later. MLX recognizes these commands:

SHIFT-S: Save	**SHIFT-N: New Address**
SHIFT-L: Load	**SHIFT-D: Display**

When you enter a command, MLX jumps out of the line you've been typing, so we recommend you do it at a new prompt. Use the Save command to save what you've been working on. It will save on tape or disk as if you've finished, but the tape or disk won't work, of course, until you finish the typing. Remember what address you stop at. The next time you run MLX, answer all the prompts as you did before, then insert the disk or tape. When you get to the entry prompt, press SHIFT-L to reload the partly completed file into memory. Then use the New Address command to resume typing.

To use the New Address command, press SHIFT-N and enter the address where you previously stopped. The prompt will change, and you can then continue typing. Always enter a New Address that matches up with one of the line numbers in the special listing, or else the checksum won't work. The Display command lets you display a section of your typing. After you press SHIFT-D, enter two addresses within the line number range of the listing. You can abort the listing by pressing any key.

The special MLX commands may seem a bit confusing, but as you work with MLX, they will become valuable. For example, what if you forgot where you stopped typing? Use the Display command to scan memory from the beginning to the end of the program. When you reach the end of your typing, the lines will contain a random pattern of numbers. When you see the end of your typing, press any key to stop the listing. Use the New Address command to continue typing from the proper location.

You can use the Save and Load commands to make copies of the completed program. Use Load to reload the tape or disk, then insert a new tape or disk and use Save to make a new copy.

Be sure to save MLX; it will be used for future ML programs in COMPUTE!'s GAZETTE.

See program listings on page 184.

SpeedScript

(Article on page 38.)

BEFORE TYPING...

Before typing in programs, please refer to "How To Type COMPUTE!'s Gazette Programs," "A Beginner's Guide To Typing In Programs," and "The Automatic Proofreader" that appear before the Program Listings.

VIC 20™/COMMODORE 64™

Ridge Runner — for the unexpanded VIC 20 on tape or disk format. 100% machine language. Maneuver your multicolor U.F.O. through a field of blinking mines while blasting spinning asteroids and various enemy ships with laser fire. Features include a horizontally scrolling playfield, hi-resolution/multicolor graphics, excellent sound, high score, pause button, bonus ships, and ever increasing levels of difficulty. Joystick required. Price: $14.95

Dungeons — for the VIC 20 with 16K expansion and tape or disk. Create characters to explore a twelve level dungeon which contains 1200 individual rooms. After you purchase your weapon and armor, you will find vast treasures and do battle with over fifty types of monsters which you must slay for experience points. Your character also has the ability to cast numerous spells and you are given the option of saving the game to tape or disk as your character gains strength and experience. Excellent sound and three dimensional graphics add to the excitement. Price: $14.95

Pak Alien — for the unexpanded VIC 20 with tape or disk. 100% machine language arcade-style game. Custom graphic characters and 100 levels of increasing difficulty. Guide your alien through a maze of interplanetary space particles dodging the seven evil aliens and clear the board before the bonus timer runs out. Joystick or keyboard. Includes pause feature. Price: $14.95

MEMORY FOR YOUR VIC-20 PLUS A LITTLE EXTRA

32K Dynamic Ram - Same type as Commodore 64
24K Used normally, for full expansion. Blocks 1, 2, & 3
"EXTRA" 8K maps into block 5, normally used for ROM cartridges (Games)
Accesses from BASIC for data storage, only through PEEK and POKE
Accesses in assembler for data, or write your own games, & boot into them normally
The 3K "Block 0" ram has been intentionally left free for the VIC Superexpander
Each 8K block can be switched in or out for compatability with games, or other peripherals.
Powered by your VIC-20 (175 ma typ)
Plugs directly into VIC expansion slot, or motherboard
Complete, assembled, and tested
90 day "No questions asked" money back return
5 year manufacturer's warranty

PCI'S COMPLETE PRACTICAL GUIDE TO THE COMMODORE 64

Where the C-64's owner's manual falls down or leaves off, PCI's Guide to the C-64 keeps you going. Over 200 pages of practical information to help you get the most out of your Commodore.

The Guide gives special attention to graphics and sound capabilities and provides practical, in-depth discussions of programs specifically developed for the Guide.

SPECIAL OFFER: To get your copy early and save $2 off the retail price, send check or money order for $12.95 before January 15 to:

PERSONAL COMPUTERS, INC.
4533 BAILEY AVENUE
AMHERST, NY 14226

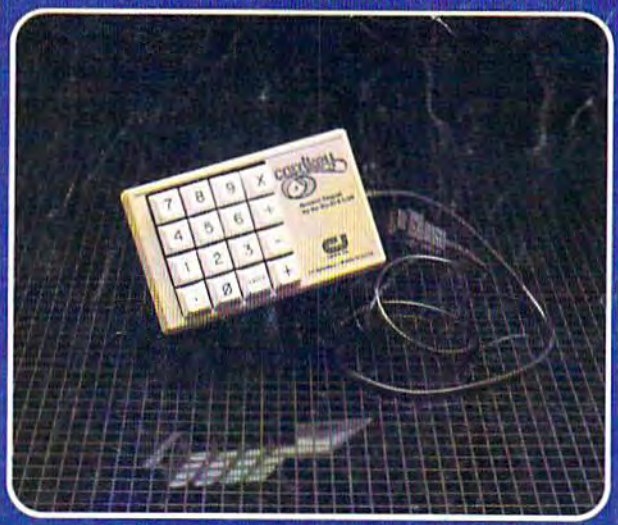
ADVERTISERS INDEX

Cardco Presents

16 Key Keypad for the VIC-20™ and Commodore 64™

The CARDKEY/1 provides an additional programable 16 keys to either the VIC or 64. This is a separate pad that plugs into the joystick port of your computer. It comes with tape programs (transferable to disk) that allow the user to define the 16 keys as any number, letter or character string value. It additionally allows the keys to be defined as strings. Another function available is the direct calculator mode in which you use your computer as a calculator. For example you press 5 + 5 (enter) and the computer prints 10 on the screen.



The CARDKEY features:

- 16 keys laid out in a calculator format
- All keys are user definable
- Keys can be defined as any character
- Keys can be defined as complete strings
- Optional calculator mode

Suggested retail: $39.95

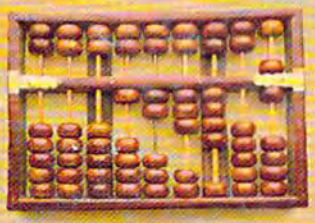
It writes, rates, creates, even telecommunicates. Costs less, does more- the Commodore 64.

When Commodore introduced the 64, the industry suddenly realized that there would be a computer in every home, school and business years before anyone ever dreamed.

That's because Commodore 64 halved the price of high technology: while you can compare the 64's capabilities with those of any sophisticated business PC, you can compare its price with that of an average television.

What can you do with it? Create with its high resolution Sprite Graphics. Add a printer and type with it. Add a disk drive to use spread sheets and other financial programs. Learn and play music through your home sound system on the 64's professional quality music synthesizer.



Add a modem, and hook up with the vast computer networks through your telephone. In short, the Commodore 64 is the ultimate personal computer, at a price you can afford.
