All standard commands PLUS bank-switching, bidirectional scrolling, IO command, track and sector editor, Sprite disable and extended life feature. SS V4) Sprite monito Fast disk copier: 1 or 2 drives; supports 1541, 1571, and 1581 🕨 Free Kracker Jax 100+ parameter disk including nibbler (for those tough back-ups).

A SHIPLOAD OF BARGAINS!

The Clipper offers members of the Ahoy! Access Club discounts and other special deals on products and services advertised in Ahoy! and Ahoy!'s AmigaUser. Your membership is free for the duration of any subscription paid for prior to December 31, 1988.

Some of the offers are cross-referenced to ads in the December Ahoy! or Ahoy!'s AmigaUser. If you subscribe to only one of the two magazines and require information that appears in the other, contact the manufacturer directly.

To take advantage of any of this month's offers, follow the instructions on the front and back of the coupon. Fill in all necessary information. And use the original coupon only-facsimiles are not acceptable. For more information, call 212-239-6089 (if busy or no answer after three rings, call 212-239-0855).

All right-they don't actually distribute Amiga merchandise at the speed of light. But if you order over \$100 worth of software from Light-Speed Distribution, they'll ship it free via UPS 2nd Day Air, which is about as close to light speed distribution as anyone comes! That's an offer available to all their customers. But just for members of the Ahoy! Access Club, LightSpeed is extending a 5% discount on all entertainment software. See their ad on pages 34 and 35 of this month's Ahoy!'s AmigaUser, or dial their toll free customer support number (800-525-4428) for more details. (Offer expires January 31.)

5% OFF

Distant Armies is sure to capture the hearts of all chess-loving Amiga users. You can read about this unique program, which traces the game through its many historical variations, in this month's Ahoy!'s AmigaUser, both on page 22 of

Scuttlebutt and in Eagle Tree's ad on page 56. But ignore the \$44.95 price listed in the ad—as a member of the Ahoy! Access Club, you can purchase Distant Armies for \$35.95—a savings of 20%! (Offer expires January 31.)

20% OFF

SOFTWARE front cover of this month's *Ahoy!*, Software Support outlines the many capabilities of V4 of the *Super Snapshot* cart-

ridge. Also described is the Super Snapshot Slideshow Creator. This utility, which lets you add video effects to screens captured with Snapshot and combine them into presentations, sells for \$14.95. But once again this month, when Ahoy! Access Club members buy Snapshot V4 for \$64.95, they can take Slideshow for \$5.00 off-just \$9.95. See Software Support's ad for shipping charges. You can order by phone if you prefer, but you must mention that you saw this offer in the Clipper. (Offer expires January 31.)

\$5.00 OFF Comp-U-Save

Along with their two full page ads in this month's Ahoy!'s AmigaUser. Comp-U-Save is offering discounts on two products. Ahoy! Access Club members can pick a pair of Z Rapid Fire joysticks for just \$20.00-\$4 off the retail price. (You'll need two anyway, unless you're the type who likes to enjoy an unfair advantage over his gaming partner.) The joysticks will work on either the Amiga or the C-64. Not offered in their ad, but sold by Comp-U-Save for \$149.99, are Speco's Shelf-Mates stereo speakers. These baby boom boxes, which plug directly into your Amiga to deliver room-filling sound, can be had by Ahoy! Access Club members for \$99.99-\$50 off the retail price. (Offer expires January 31.)

\$54 OFF

Shopping for an Amiga 500? ComputAbility's ad on page 71 of this month's Ahoy!'s AmigaUser offers the computer, as well as a wide selection of Amiga peripherals and software. But you won't find a price listed for the Amiga 500-ComputAbility prefers that you call to get their latest. most competitive price. When you call, mention your membership in the Ahoy! Access Club. If you buy the Amiga 500 from ComputAbility, they'll throw in free Epyx software-for Club members only! ComputAbility's toll free number is 800-558-0003. (Offer expires January 31.)

Comput Ability

FREE SOFTWARE

The onset of the cold, flu, and virus season in much of the country should remind us—it's always virus season on the Amiga. But Virus Infec-

SOFTWARE But Virus Infection Protection offers help—and Discovery Software continues to offer Ahoy! Access Club members a special deal on V.I.P. Buy two or more Discovery products by the end of January, either direct from Discovery or at any retail outlet. Send Discovery proof of purchase, with date of purchase indicated, for both products, and they'll send you a free copy of V.I.P.—regularly \$49.95. (Offer expires January 31.)

FREE V.I.P. Computer Repeats

Here's an offer from Computer Repeats that you won't see repeated elsewhere—it's for Ahoy! Access Club members only. You can purchase an Amiga 500, a \$350 retail value VCR, and \$450 worth of software for only \$849—a savings of **\$750 off** the combined suggested retail price of \$1599!

In addition, Computer Repeats is continuing to offer our members higher trade-in values for their used equipment. You can get a 1581 disk drive for \$69 with trade-in of your 1571 disk drive; or \$114 with trade-in of your 1541 drive. Or, take a C-128D for \$229 with trade-in of either your C-128 and 1571 drive, or of your 64C, 1541-II, and 1525 printer. See Computer Repeats' ad on page 59 of this month's *Ahoy!* for more information, or call 303-939-8144. (Offer expires January 31.)

www.commodore.ca

If you haven't joined Q-Link yet, there's no time like this month-when Q-Link is offering new members a free modem and membership kit. Turn to page 6 of this month's Ahoy! for details. If you decide to take Q-Link up on that offer, take them up on this one as well-a free Rabbitjack's Casino Game Disk (value: \$7.50) for Ahoy! Access Club members who join Q-Link this month. (The disk allows you to gamble online with other Q-Linkers.) Fill out and send both this coupon and the coupon from Q-Link's ad, or call 800-782-2278/ext 1697. (Offer expires March 15.)

FREE DISK

Pacific Peripherals

Again this month, Ahoy! Access Club members get an offer on Pacific Peripherals' OverDrive hard disk controller (with or without hard drive) or SubSystem expansion chassis (see their ad on page 31 of this month's Ahoy!'s AmigaUser). When you order direct from Pacific, they will waive the credit card surcharge normally levied, and provide **free shipping** (Sub-System by UPS ground, OverDrive and disk drives by UPS 2nd Day Air). (Offer expires January 31.)

FREE SHIPPING

CHIP LEVEL DESIGNS

For a second month, Chip Level Designs offers a special deal to Ahoy! Access Club members who purchase either of their C-64/1541 hardware accelerator kits-RapiDOS or RapiDOS Professional. Buy either, and Chip Level will include a free copy of their Parallel Utilities (\$24.95 retail). The disk offers the same capabilities as Chip Level's Mass Duplicator 1541 (see page 9 of this month's Ahoy!), with individual file copiers for Rapi-DOS thrown in. Your price is \$49.95 for RapiDOS or \$99.95 for RapiDOS Professional, plus \$3.00 shipping. (Offer expires January 31.)

\$25 DISK FREE

Lyco Computer

Lyco's ad on pages 42 and 43 of this month's *Ahoy!* tells you about the FSD-2 Excelerator Plus disk drive faster, quieter, more compact, and more reliable than the 1541, and featuring a separate power supply and a full one-year warranty. And once again this month, *Ahoy!* Access Club members who prepay for the drive (\$149.95 via check, money order, or credit card) receive **free shipping**. (Offer expires January 31.)

BRIWALL

FREE SHIPPING

If you're reading these words in early December, as we expect you are, there's still time to get in on Briwall's offer of a **free copy of Free Spirit's Christmas Classics.** Order \$75 or more from Briwall's ad on page 39 of this month's *Ahoy!* and receive *Christmas Classics* for the C-64 (list price \$9.95); order \$100 or more and get *Christmas Classics* for the Amiga (list price \$14.95). For more information, call Briwall at 800-638-5757. (Offer expires January 31.)

FREE DISKS

tries' Perfect Vision and Color Splitter hardware make an unbeatable team for cap-

SunRize Indus-

turing monochrome and color images on your Amiga. As you can see in SunRize's ad on the inside back cover of this month's *Ahoy!'s Amiga-User*, the units retail for \$249.95 and \$99.95 respectively. But *Ahoy!* Access Club members who order both *Perfect Vision* and *Color Splitter* direct from SunRize can take **\$50 off** – and purchase both items for only \$299.95. (Offer expires January 31.)

\$50 OFF

Satisfied owners of SPOC's disk of family-oriented programs (see page 40 of this month's *Ahoy!'s AmigaUser*) will surely want to acquire the separate SPOCPD collection of completely debugged, enhanced public domain programs—especially at the bargain price offered to *Ahoy!* Accesss Club members. The collection normally retails for \$20.00; but this month, as last month, Club members pay only \$15.00 – **\$5.00 off**. (Offer expires January 31.)

\$5.00 OFF

PIONEER COMPUTING

This month Pioneer offers Ahoy! Access Club members their 65 megabyte hard drive at a discounted discount! Last month the drive, which retails for \$949.99 (see page 77 of this month's Ahoy!'s AmigaUser), sold to Club members for \$879.99. This month your special price is \$759.99 – **\$190 off!** Add \$11.50 for shipping if you live in the Continental US; if you live elsewhere, call Pioneer at 801-942-1174 to determine your shipping charge. (Offer expires January 31.)

STILL VALID

The following offers from the December *Clipper*, not repeated in this edition, remain valid until December 31. Call the *Ahoy!* Access Club (212-239-6089 or 0855) or the individual companies for details.

DIGITEK SOFTWARE

Buy one program and take a second at **half price**; or buy two programs and take a third **free** (DigiTek, 104 West Seneca, Suite 4, Tampa, FL 33612; phone 813-933-8023).

DIGITRONICS

Take **10% off** the \$225 list price of their RC4 Ramcard—you pay only \$202.50 plus \$4.05 shipping (Digitronics, PO. Box 206, Villanova, PA 19085; phone 215-459-4493).

DUNE SYSTEMS

Buy their 64/128 Chip Checker at **\$10** off its \$159 list price—only \$149. Or buy their PC Chip Checker at **\$15** off—only \$244. Add \$4.00 for shipping (Dune Systems, 2603 Willa Drive, St. Joseph, MI 49085; phone 616-983-2352).

CREATIVE COMPUTERS

5% discount on every order of \$50 or more, plus free shipping (Creative Computers, 4453 Redondo Beach Blvd., Lawndale, CA 90260; phone 213-370-2009).

SOGWAP

Buy *Big Blue Reader* at **20% off**. For the 128 version, pay \$35.95 (list price \$44.95); for the 64 version, pay \$23.95 (list price \$29.95) (SOGWAP, 115 Bellmont Road, Decatur, IN 46733; phone 219-724-3900).

P.A.V.Y.

Buy Landmark, The Computer Reference Bible for \$119.95-**\$10 off** their special fall price of \$129.95 (P.A.V.Y., P.O. Box 1584, Ballwin, MO 63022; phone 314-527-4505).

TOTAL BACK UP POWER TAKES ACTION REPLAY IV THE UITIMATE UTILITIES/BACK-UP CARTRIDGE FOR THE 64/128

· Action Replay allows you to Freeze the action of any memory Resident Program and make a complete back-up to disk or tape - but thats not all Just compare these features

Simple Operation Just press the button at any point and make a complete back up of any' memory resident program to tape or disk

Turbo Reload. All back ups reload completely independantly of the cartridge at Turbo speed.

Sprite Monitor: View the Sprite set from the frozen . program - save the Sprite - transfer Sprites from one game to another. Wipe out Sprites, view the animation on screen Create custom programs.

Sprite Killer. Effective on most programs - make yourself invincible. Disable Sprite/Sprite/Backround collisions

Unique Picture Save Freeze and save any Hires Screen to tape or disk. Saved in Koala, Blazing Paddles Format

UNIQUE FEATURES:

WARP 25

Loads SOK in under 5 seconds!! it true action replay festures "Burp 25" the world's fas is serial farms. A typical backup will relead in under 5

Storada.
No additional hardware required No special formats
Super reliable Remember this is not a system where files have to be converted - with action replay you simply ward directly into Warp 25 status - reload in second. Backup all your existing programs to load at unbelevable speed! Beckup AN has no hoad rem it can also load commercial disks directly at 25 times speed.
Tais is unsigns to Action Replay!
Warp Save/Load Available straight from Basic.

Plus unique Code

Cracker Monitor Prese any program and enter a full machine code monitor Phil Monitor Peatures — Disassemble, Hex, Pind, Jump. Compare, Replace, The Way Scrout, Bull Disk Load Swav, Printer Support etc. In fact all usual monitor commands plus a few others Decause of Action Replay's on Board Ban the Prosen program can be looked at in the BNTRETY — In it's Prosen state. That means Wide Ban, 2cro Page dc. and remember you see the code in it's Prozen state not in a Beset state as with competitors products. Becaust the program at any point Mice Construction — An absolute must for the program Hacker — make changes and use your pressive instantion

mpa etor cient compacting 3 programs per disk if you use both cides. and saved as a single

atibility A host of additional commands: ppend, Old, Delete, Linesave, Printon

Screen Dump; Print out any Screen to Host or Printers. 16 Gray Scales, Double size print options.

Unstoppable Reset: Reset button to Rectrieve stem and Reset even so called Unstoppable Sys Programs

Fully Compatible: Works with 1541/C, 1581, 1571 and Datacassette with O64, 128, 128D (in 64 Mode)

Compatible: With Fast DOS and Turbo Rom Systems Disk Utilities: Fast Format, Directory, List, Run and many other key commands are operated by Function Кеув

Unique Restart: Remember all of these utilities are available at one time from an integrated operating system. A running programme can be Frozen to enter any Utility and the program is restarted at the touch of a kny..., without computing a key - without corruption.

IS1 Logic Processor: This is where Action Replay IV gets it's power. A special custom LS1 chip designed to process the logic necessary for this unmatched Freeze/Restart power. No other cartridge has this power!

ONLY \$49.99

MUMMINI **ROM II** Turbo Rom II is a replacement for the actual kernal inside

TURBO

your 64. It provides superfast load/save routines. Loads/Saves most programs at 5-6 times normal speed.
 Improved DOS support including 10 sec

Programmed function keys:- load, directory, old, etc. Return to normal kernal at flick of a

FCOPY - 250 block file copier.

FLOAD - special I/O loader. Plus lots more.

Pitted in minutes - no soldering usually required. (On some 64's the old ROM may have be desoldered). ONLY \$24.99

256K SUPEROM EXPAND

Now you can select from any of 8 32K EPROMs 8 sockets to accept upto a 32K EPROM in each. On board operating system - no programs to load

Program your own EPROMs using our EPROM programme

No need to have loads of cartridges - just make a selection from the Superom menu.

Directory of utilities on power up.

Fully menu driven on power up.

Select any slot under software controls. Unique EPROM generator feature will take your own programs - basic or m/c and turn them into autostart EPROMs. (EPROM burner required)

Accepts 2764/27128/27256 EPROMs. ONLY \$49.99

EPROMMER

6ATM

A top quality, easy to use EPROM programmer for the 64/128.

Pully menu driven software/hardware package makes programming/reading/verifying/ copying EPROM's simplicity itself. Will program 27256 chips. 12.5, 21 or

25

Fits into user port for maximum com-patibility with cartridges/Superom Board etc. Pull feature system - all functions covered including device check/verify. We believe Eprommer 64 is the most com-prehensive, most friendly and best value for money programmer available for the 64/128. Ideal companion for Superom Board. Cartridge development System, our kernal expanders or indeed any ERPOM base

Comes complete with instructions - plus the cartridge handbook.

DEEP SCAN BURST NIBBL 3 14

The most powerful disk nibbler available anywhere, at any price!

Burst Nibbler is actually a two part system - a software package and a parallel cable to connect the 1541/1570/1571 to 64/128 (state type).

What gives Burst Nibbler its power? Conventional nibblers have to decode the data from the disk before it can transfer it using the serial bus — when non standard data is encountered they are beat. Burst Nibbler transfers data as raw GCR code via the parallel cable without the need to decode it so you get a perfect copy of the original

- Will nibble upto 41 tracks. Copy a whole disk in under 2 minutes. Full instructions.
 Regular updates we always ship the latest. Fitted in minutes no soldering usually required.
 Full cr¹₂ tracks. No need to buy parallel cable if you have Professional DOS etc.
- Cable has throughbus extension for other add ons.

ONLY \$39.99 COMPLETE CABLE ONLY \$19.99 SOFTWARE ONLY \$19.99 **BURST NIBBLER PARAMETER DISK**

Burst Nibbler is the most powerful Nibbler around - but even the best can be better This disk contains dozens of parameters specially written for the protection schemes impossible to Nibble. These are making 'V max' and Rapidok' and include titles units as 'Defender of the Orewn' cantitate to. I Replacity updated to include any new titles. This disk is by no means a necessity - the standard Burst Nibbler will copy 96% of software as is - if you want to go to the limits, this is the

DATEL COMPUTERS

There's so much to do on Q-Link, it can't all fit into this ad. For that, you'll need our full-color program guide, with a complete calendar of events and activities. And you'll get that free from Q-Link every month.

Getting into Q-Link.

You'll love being a member of Q-Link. You pay only \$9.95 a month (and any local phone charges) for "Basic" service, which includes unlimited access to the latest news, sports, and entertainment information. Even a full-featured encyclopedia. We also offer "Plus" services such as shopping and travel reservations for only 8¢ per minute extra.

It's time you and your Commodore got out and talked to more interesting people than just each other. And on Q-Link, it couldn't be easier.

<section-header><section-header><section-header><section-header><complex-block><complex-block><section-header><section-header><image><section-header>

Welcome to Q-Link.

You and your Commodore[®] probably have a very good relationship. But even the best relationships need to grow. That's why there's Q-Link.

Q-Link connects you with tens of thousands of friendly, interesting people all over the country. Share stories, talk shop, tell jokes, or just shoot the breeze with them in a whole new way. On your Commodore.

When you and your Commodore start talking to the rest of the world with Q-Link, exciting things start to happen. Things that are sure to improve your relationship. Like playing the latest interactive, fullcolor games. Taking college courses. Accessing over 15,000 software programs. Enjoying guest speakers on a wide range of topics.

And Q-Link gives you a direct connection to the experts at Commodore headquarters as well as the major software publishers – a Q-Link exclusive.

Add new life to your Commodore:

hink fast-what were you doing five years ago this month?

IEW FROM THE BRIDG

When you work in publishing, a question like that is easy to answer. Five years ago from the time we write these words, we were putting the final touches on the first edition of a new magazine. And five years ago from the time you read these same words, the first issue of *Ahoy!* went on sale.

Though it probably didn't show, editors Tim Moriarty, Bob Sodaro, and the undersigned spent the better part of three months planning and assembling that premier issue – sort of a "spare time" project in between editions of Videogaming & Computergaming Illustrated. Our early evening sessions were frequently interrupted by an engineer named Morton Kevelson who would ride the subway up after work, loaded down with half-inch thick stacks of fanfold paper he called reviews and carousels full of color slides of disemboweled hardware. Programmers David Barron, Michael Kleinert, and Pete Lobl, whose combined ages would barely qualify them to run for President, hung around after school and answered some of the three Ahoy! editors' more complex technical questions, like: "How do you turn the C-64 on?" Richard Herring, Dale Rupert, and others lent

their expertise from afar. Somehow, that first issue went off to the printer, and the staff wondered—would it fly? (Or "sail," as we immediately corrected ourselves.) All except for Michael Schneider, who spent a lot of time reading sales reports on the Commodore 64—and smiling.

Our first cover story, titled "Can the 64 Crack the Peanut?" concerned the threat posed to Commodore by IBM's coming entry in the home computer market. (Historical postscript: HA!) The issue also featured our first programs-the Multi-Draw 64 graphics system and the Interrupt Music Maker/Editor. If you wanted to use either program, you had a hard way to go. You couldn't buy them from us on disk (though you probably didn't own a disk drive anyway). There was no Bug Repellent to help you out (not until Issue 4). It occurred to no one to print our phone number in case readers encountered problems. And, yes, there were problems-a nasty bug in each program.

Also in that issue-the first *Rupert Report*, titled "Don't Curse that Cursor!"; fourteen pages of new products; nine pages of reviews; the first *Commodares* (and the only one not written by Dale Rupert); an editorial by Ben Bova; and articles on C-64 memory and sequential file programming.

Readers who joined us much later can't imagine how exciting those early months were. It seemed that every month brought news of yet another product that took the 64 someplace no one had ever imagined it could go. Remember the advent of speech synthesizers? Dual and one megabyte disk drives? Hardware attachments for applications like weather forecasting, home security, and stress management?

It's true that today's home computers make daily strides that dwarf anything in the C-64's history. But if you were there, you understand why watching the progress of the Amiga or the Macintosh could never be as exciting as growing up with the 64.

We are deeply honored by the role you've allowed us to play in that growing process. Chronicling the progress of the Commodore home computers these past five years has been exciting; the sense that our efforts are appreciated, gleaned from thousands of letters and phone calls, has been gratifying.

Fortunately, the 64 and 128 are still going places where no one imagined they could – and we wouldn't miss it (or the chance to tell you about it) for the world! – *David Allikas*

Save even more on top of the already money-saving subscription rates for *Ahoy*! and the *Ahoy*! program disk!

If you subscribe to the *Ahoy! Disk Magazine* – magazine and disk packaged together – you'll receive the two at substantial savings over the individual subscription prices!

YEARLY SINGLE ISSUE PRICE		SEPAR SUBSCRI	ATE PTION	AHOY

CUTTLEPUTT

READING HELP

Readup has released the second in its series of Supplemental Diskettes for use with their Accelerated Reader reading comprehension program. Like the previous installment (Diskette 101-150), Diskette 151-200 contains tests for 50 books for second to sixth graders. The Supplemental Diskettes are available to present users or new purchasers of the Accelerated Reader for \$50 each. The entire Accelerated Reader package for the C-64 lists for \$300.

Readup Inc., 800-338-4204 or 715-887-2333 (see address list, page 14). Circle #230 on Reader Service

COMPUTER ON PATROL

Total Security (\$29.95) allows the 64 or 128 to be used as an alarm system. Up to 10 sensors (not included, but readily available at electronics stores) can be wired to a joystick cord to detect entry, serve as temperature alarms, etc. The program sounds an audible alarm over the monitor speaker and dials any two phone numbers (modem required) when a violation occurs, and also prints out the time and area of the violation.

Megasoft Canada, 705-746-8081 (see address list, page 14). Circle #227 on Reader Service Card

ANOTHER RETURN

Nothing is certain in life except death, taxes, and a new version of Taxaid. For the eighth consecutive year, the income tax preparation program for the C-64, 128, and Plus/4 has been updated, this time to include all the current tax law changes for tax year 1988. The program prepares IRS Form 1040, Schedules A-E and SE, and Form 2441 (Child Care). Calculations are automatic, and all tax tables are built in. Printout is in IRS-approved format on plain

The second supplemental disk for The Accelerated Reader contains tests for 50 children's books. Among the titles included are Socks, The TV Kid. Ramona Forever, Stuart Little, Justin and the Best Biscuits in the World, 4B Goes Wild, The Comeback Dog. and The Castle in the Attic.

BASIC READING THE a envie hone

paper. Price is \$49.95; updates for 1989 will be available for \$18.00.

Taxaid Software, Inc., 218-834-5012

(see address list, page 14). Circle #228 on Reader Service Card

MODERN MIDI

RTX8, a MIDI processor for the C-64, is now available in version 5.0. Designed for the live performance musician who needs simultaneous multichannel access from a single MIDI keyboard, the program includes a utility for live patch number translation, "panic buttons," MIDI data monitor, and other features. The program will run with any MIDI keyboard with any number of multitimbral synthesizers connected to a C-64 with a standard MIDI interface.

Realtime Music Publishing (see address list, page 14). Circle #229 on Reader Service Card

SMALL TALK

The direct connect, Hayes- and 1670compatible Minimodem-C can run virtually any terminal software for the 64 or 128. The 300/1200 baud unit, which measures only 5 x 2.75 x 0.75", sports a complete set of status indicator lights. The Hayes AT command set is supported and software-selectable; default settings are switchable via internal DIP switches. "S" register status and result codes, plus several modes of autotest.

DESIGNS PRESENTS CHIP LEVEL 128 mode &

CP/M version now HE SUPER-FAST PARALLEL DISK OPERATING SYSTEM FOR THE COMMODORE 64 AND 1541 DISK DRIVE!

- All disk access is handled at super-fast parallel speed! (LOAD, SAVE, directory, SEQ & REL files, scratch, validate, format).
- Designed to support multiple drive systems. •Parallel Centronics printer support with file
- spooling capability.
- Many useful, timesaving features (DOS) Wedge, screen dump, resident monitor). No loss of compatibility.
- Far too many features to list in this ad . . . and perhaps in this magazine!
- (Call or write to get all the details!)

... and if you want the ultimate, get RapiDOS Professional!

- Gives even faster disk access!
- Uses 8k RAM track buffering and hardware GCR conversion!
- Provides 40 track extension (749 blocks free!) Adds 20 new disk commands (i.e., lock files, change disk name).

Here's what people are saying about RapiDOS:

Mike J. Henry (Basement Boys Software) - "It's amazing how incredibly fast it is, I'm impressed!" Mitch S. (Eaglesoft Inc.) - "Very fast, very reliable, and very compatible. I love it!" J.F. Jones (ADP) - "Superbases' speed is increased greatly, and it's now a dream to use!"

Function	Normal DOS	RapiDOS	RapiDOS Pro	Your System
Load 202 blocks	128 sec.	15 sec.	3 sec.	
Save 202 blocks	196 sec.	98 sec.	8 sec.	No. of Contract
Format 35 tracks	90 sec.	24 sec.	18 sec.	

Compare these speeds with your current system and see why RapiDOS puts the C-64 into a different league!

RapiDOS requires a socketed kernal ROM U4, and is available in versions for the 64c, 128 in 64 mode, and 1541c (please specify when ordering). RapiDOS is easily upgradeable to the Professional Version. RapiDOS Professional drive controller is (c) '87 mts data GbR, the creators of the best European parallel systems.

At these affordable prices no C-64 owner should be without RapiDOS! \$99.95

RapiDOS \$49.95 RapiDOS Professional

MASS DUPLICATOR 1541

- •For the C64/128 with a single 1541 disk drive.
- 15 second, 4 pass backup for standard disks!
- 25 second full GCR Super Nibbler, the most powerful yet!
- •9 second disk format!
- Fast loader!

\$32.95 Quick installation.

Can be upgraded to RapiDOS

MASS DUPLICATOR MSD

- A must for any MSD SD-2 owner.
- •15 second standard disk backup!
- •18 second full GCR Quick Nibbler!
- •9 second disk format! \$25.95

MSD AUTO COPY ROM

- Adds new Fast Backup commands!
- •Turns the MSD SD-2 into a dedicated copying drive (no computer needed). \$29.95

C-64 BURST-ROM

- ·Gives the 64 'Burst Mode' when used with a 1571 or 1581 disk drive!
- Loads 100 blocks in 6 seconds on a 1571, 4 seconds on a 1581!
- ·Fast directory, SEQ, and REL file access!
- Built in DOS wedge!
- Simple installation.
- (Kernal ROM U4 must be socketed) \$39.95

C-128 BURST-ROM

- . Lets the 128 run at 'Burst' speed when in 64 mode!
- ·Provides the same features as the C-64 Burst-ROM! \$49.95

STILL TO COME

- MSD SD-1 Fast Copier!
- 1571 Mass Duplicator!
- 1581 Utility Pack!

TURBO 64

- ·Speed-up cartridge for the C-64, just plug it in!
- Adjust the clock rate from 100 khz (1/10 normal) to 4 mhz (4x normal)!
- •Uses 8/16 bit 65816 microprocessor (same as the Apple][gs... but twice as fast)!
- ·Spread sheets, BASIC, flight sims, graphics, and now GEOS ... all are accelerated! \$199.95

Minimodem-C has all the features of many larger units, but the 5 x 2.75 x 0.75" unit fits neatly behind the computer, occupying almost no desk space.

are also standard. Line responses can be heard through the built-in piezo speaker. Operational modes include 2 wire full duplex, auto dial, auto answer, auto redial, busy tone detect, and dial tone detect.

The \$74.95 price includes Multiterm software and a free trial hour on CompuServe. A two-week trial and a oneyear warranty are also given.

Aprotek, 805-482-3604 (see address list, page 14). Circle #234 on Reader Service Card

CHART WITH GEOS

geoChart (\$29.95) allows you to import data from any GEOS program (GEOS 1.2/1.3/2.0, GEOS 128, geoFile, geoCalc, etc.) to create charts. Nine types are available, including pie, unibar, area, point, line, column, bar, scatter point, and scatter line; chart type can be changed without reentering data. Up to 80 values can be charted (4 data series of 20 points each), or more via a mechanism for selecting subsets of values to plot. 32 fill patterns are provided for pie, area, unibar, bar, and column charts, along with 4 marker types for scatter point and scatter line charts. Text and percentage values can be displayed or hidden.

Berkeley Softworks, 415-644-0883 (see address list, page 14). Circle #256 on Reader Service Card

FAX ON FILE

Users of CompuServe's EasyPlex

10 AHOY! and InfoPlex electronic mail services can now send messages directly from their computers to facsimile machines anywhere in the world, without having to produce a printed document first. Price within the 50 states is 75¢ for the first 1000 characters and 25¢ for each additional 1000 characters (50,000 character limit on EasyPlex). International prices are based on the destination country and the length of the message.

CompuServe, 614-457-8600 (see address list, page 14). Circle #257 on Reader Service Card

DISK LABEL KIT

Erase-a-Label eliminates the need to peel outdated labels off your diskettes. You affix one of the super-adhesive, curlproof labels to your disk, and write on it with the special pen provided. When it comes time to change the information on your label, the ink wipes off with a dab of alcohol.

Erase-a-Label, 214-387-9303 (see address list, page 14). Circle #233 on Reader Service Card

CLEAR THE WATERS

If you've found Strategic Simulations' Pool of Radiance to be about as clear as Boston Harbor, a new clue book can help you with this first in SSI's series of AD&D-based fantasy role-playing games. The book is a complete player's guide with maps of every location in the game, and descriptions of all major encounters, as well as passwords, mazes, and illusions. Included are specific tactics for surviving the game's most challenging encounters, strategies

No more stacking labels so high that you can't squeeze your disk into the drive-with the Erase-a-Label system you can reuse the same one indefinitely.

for successful combat, and information about which combinations of character classes and races make the best adventurers.

GAMES

The latest in Accolade's Avantage series of mid-priced games, Jet Boys (\$14.95) lets one or two players take the role of a jetpack-equipped commando whose mission is to enter and deactivate an enemy-controlled reactor room. First the player must survive numerous waves of attacks by galactic terrorists. In the two-player "cooperative" mode, players pool their resources and fight the bad guys together. There are four levels of play; to advance from each level, the player must destroy a megabeast that blocks the way.

2UPIERT REPORT

he 320 by 200 dot image on the high resolution screen represents 64,000 pixels. To store such an image normally requires at least 8000 bytes of data (more if colors are included). This month we will discuss a technique based upon fractal compression by which some very complex images can be represented with as few as 14 floating-point numbers. Watching the images appear from apparent randomness is an interesting experience. The process of encoding your own images can be a true intellectual challenge.

This month's title *Fractal Recreations* is meant to be interpreted two ways. In the first sense, we will discuss algorithms and programs for encoding and recreating complex images which are represented by means of a concise, fractal-compressed storage scheme. In the second sense, you should find (literally) hours of entertainment experimenting with these thought-provoking concepts.

The ideas and algorithms discussed here are derived from a wonderful book, *The Science of Fractal Images* (Springer-Verlag, 1988) edited by Peitgen and Saupe. In particular Chapter 5 of that book written by Michael Barnsley, and an article based upon the same ideas by Barnsley and Alan Sloan in *Byte* magazine (January 1988), provide the details and programming examples which are herein adapted and clarified.

The image-generating program in this article is written for the C-128. C-64 users must provide a high-resolution pixel plotting routine and modify the program accordingly. We have presented programs and procedures in previous *Rupert Reports* which allow C-64 users to plot high-resolution graphics on their machines (see *Ahoy!* June '85, July '85, and January '88), and you should refer to them.

CREATING IMAGES

Having the computer restore compressed images on the screen is the easy part. Select a line number for the RE-STORE statement in line 20 of the program *Fractal Decoder* (on page 69) corresponding to a set of DATA statements for the desired image. Then type RUN.

At first an initialization screen appears. During this time, the computer is calculating the first 100 points of the image without displaying them. The program is determining the approximate range of horizontal and vertical values which are to be plotted. The image will then be automatically scaled to fit the screen.

The main loop of the program continues calculating new points for the specified image, and it plots them on the highresolution (320 by 200) graphics screen. If a point is calculated which would be off the screen, it is displayed at the screen boundary, and the image size calibration values are updated.

If after a while it appears that some of the image is off the screen, you may change the size of the image. Simply press the space bar. The latest image size calibration values are then used to redefine the image size. The old image is erased, and the main loop continues plotting points. Now the entire image (or at least more of it) should fit on the screen.

The points comprising the image appear on the screen in a controlled but random order. How can that be? The general region of the image in which to plot a point is picked at random. The specific point in that region is calculated from the previously plotted point as well as from the values listed in the DATA statement for the image.

The main loop of the program generating these complex images (from lines 440 to 620) is surprisingly simple. Lines 470-510 randomly pick a value of J from 1 to JMAX. JMAX is the number of transformations which define the selected image. JMAX is the first item in the DATA statements for each image.

Each compressed image is stored as a collection of transformations. Each transformation is represented by six numbers. Also, each transformation has a "weighting" or probability associated with it. Thus there are seven numbers given for each transformation. We will investigate transformations later when we learn how to encode an image into this compressed form.

Lines 520-540 use the randomly chosen J value to pick and combine the set of values A(J) through F(J) corresponding to one transformation. The horizontal coordinate of the next point to be plotted is calculated in line 520 (NX). The vertical coordinate is calculated in line 530 (NY). These calculations depend upon the selected transformation coefficients (A(J) - F(J)) as well as the previous X and Y values. The current X and Y values are saved in line 540 for use the next time around.

Line 550 scales the calculated point according to the graphics window size calculated during initialization. Any points which are off the screen are drawn at the edge of the screen. Also in lines 560-590 the minimum or maximum coordinate parameters are updated for any point which lies off the screen.

The point is plotted in line 600. Details of the graphics window calibration and scaling formulas are presented in Windows, Viewports, and a Moebius Strip (Rupert Report, September 1986 Ahoy!). If no key is pressed, the loop start-

FIGURE 1: TRIANGLES

ing at line 460 is repeated.

If the space bar is pressed, line 640 clears the graphics screen and branches to line 380 where the window constants are recalculated according to the current minimum and maximum coordinates found so far. The image is then begun again but at a smaller scale.

Replace the 1000 in line 20 with 2000 through 7000 in turn to generate the different images. Next we will discuss how to represent other images in this compressed format. Then you can add your own DATA statements to the program.

COLLAGES AND TRANSFORMATIONS

We will now look at the procedure which allows us to convert an image of 64,000 pixels into a handful of transformation coefficients. Calculating the transformation coefficients is somewhat more difficult than running the program above to generate the images, but it is definitely manageable. Although there is a significant amount of mathematical theory supporting the process, all we need is the ability to make a collage.

(Note: Collage is an art form in which the image is composed of smaller pieces or objects typically glued to the paper, overlapping one another. We all made autumn leaf collages in kindergarten, didn't we?)

First, find an image which is a suitable candidate to be compressed. The best images are like those presented in the DATA statements of the *Fractal Decoder* program and shown in Figures 1-5.

They may be very complicated images, but more important, they can be approximated by overlaying smaller, similar images (hence the collage concept). We will work an example to show how this is done.

Consider the large triangle shown in Figure 6. Clearly it can be exactly covered by the four smaller, similar triangles I-IV. Three of the small triangles (I-III) have the same orientation (pointing to the right) as the original, and the fourth triangle has been flipped over to point left.

These four triangles correspond to four transformations of the original triangle. A transformation consists of changes in size (called scaling), location (translation), and/or orientation (rotation). By performing one or more of these three operations, we "transform" the original triangle into

24 AHOY!

one of the smaller ones.

Once we have figured out how to make a collage of transformed triangles to closely overlap the original image, we must calculate six numbers which define each transformation. We will calculate these coefficients for one transformation at a time.

The program *Solver* (see page 70) does the mathematical dirty work to calculate the transformation coefficients. It is based upon a program in the book *Numerical Methods for the Personal Computer* by Terry Shoup (Prentice-Hall, 1983). The program solves six simultaneous equations for six variables A-F. We must supply X and Y values for any three points in the original image and the corresponding three sets of X and Y values of the transformed image.

We have arbitrarily defined the height (Y direction) of the original triangle in Figure 6 to be 4 units and the width (X direction) to be 2 units. Any scale will do. The three points L, M, and N correspond to the three vertices (going counter-clockwise) of the original triangle. In triangle I, the corresponding points are identified as L' (read L-prime), M', and N'.

The X and Y coordinates of these six points are fed into Solver, which calculates the transformation coefficients for triangle I. This table summarizes all X,Y coordinates for corresponding sets of points in the original and the four transformed triangles.

Point	Original	1	Ш	III	IV
L	0,0	0,0	1,1	0,2	1,3
M	2,2	1,1	2,2	1,3	0,2
N	0.4	0.2	1.3	0,4	1,1

Notice that for triangle IV, it is assumed that the original triangle was shrunk and then rotated 180 degrees about its center point. Consequently the lower left corner L of the original triangle is at the upper right corner of triangle IV.

(Note: We could also have assumed that the original triangle was just flipped right to left so that its lower left corner is now the lower right corner of triangle IV. Because of symmetry in this example, the resulting images would be the same even if the transformations were different.)

The DATA statements beginning at line 40 of *Solver* store pairs of coordinates for the original image and one of the transformed images. As shown in the listing, the three points of the original triangle are in lines 40, 42, and 44. The corresponding points of triangle I are in lines 41, 43, and 45. When you run the program, the transformation coefficients A-F are calculated to be

Α	В	С	D	E	F
.5	0	0	.5	0	0

A and D tell how much the triangle was shrunk (scaled) in the X and Y directions respectively. The B and C values are related to amount of rotation of the transformed image. E and F tell how much the new image is shifted or translated in the X and Y directions from the original.

From these transformation coefficients, we can see that

www.commodore.

triangle I is the result of shrinking the original to half its initial size in the X and Y directions (A=D=0.5). It is not rotated (B=C=0), and it is not translated (E=F=0) since its lower left corner coincides with the original.

Now put the data for triangle II into lines 41, 43, and 45 and run the program again. The transformation coefficients A-F for this triangle are 0.5, 0, 0, 0.5, 1, 1. The values of E and F tell that this triangle is shifted 1 unit to the right and 1 unit up from the original triangle. This is seen by comparing their lower left corners.

Replacing the data in lines 41, 43, and 45 with values for triangle III and then again for triangle IV gives the following set of transformation coefficients for the four triangles:

Triangle			Coef	licients		
	Α	В	С	D	Е	F
1	0.5,	0,	0,	0.5,	0,	0
11	0.5,	0,	0,	0.5,	1,	1
III	0.5,	0,	0,	0.5,	0,	2
IV	-0.5,	0,	0,	-0.5,	1,	3

Notice that the transformation for triangle IV has negative scaling factors. These correspond to flipping the image in the X direction and then in the Y direction (as well as shrinking it by 0.5). Can you see why E and F are 1 and 3 for triangle IV?

Each transformation must be given a probability factor for use in the *Fractal Decoder* program. This factor must be between 0 and 1. The sum of the probabilities should be 1.00. One way to pick these probability factors is to use the ratios of the areas of the transformed images. Since all four of our triangles are the same size, we can give them equal probabilities of 0.25.

Now we are ready to try this data in *Fractal Decoder* to see if it does generate the image of a triangle. Change line 20 to RESTORE 8000. Then add these lines:

8000 DATA 4

8010	DATA	0.5,	0,	0,	0.5,	0,	0,	0.25
8020	DATA	0.5,	0,	0,	0.5,	1,	1,	0.25
8030	DATA	0.5,	0,	0,	0.5,	0,	2,	0.25
8040	DATA-	-0.5,	0,	0,-	-0.5,	1,	3,	0.25

FIGURE 2: SPIRALS

FIGURE 3: FOSSIL SNAIL

The first data value identifies the number of transformations. The next four lines contain the transformation coefficients A-F and the probability for each.

ON YOUR OWN

You can make triangle IV appear "lighter" with fewer points by reducing its probability. Change the last values in lines 8010-8040 to 0.3, 0.3, 0.3, and 0.1. In this case the points in triangle IV will be chosen one-third as often as in any of the other triangles.

Now that you know the procedure for calculating transformation coefficients and have some feeling for the meanings of the individual coefficients, let the experimentation begin.

Try "moving" triangle II a little further to the right and see how that affects the whole picture. Recall that the E coefficient defines the amount of X translation. Change the value of E in line 8020 from 1 to 2 and see what happens. Instead of creating a solid image, these transformations define an unexpectedly complex image with an intricate, symmetric hole structure.

Whenever the original image is not exactly overlaid by its transformed images, those transformations will not exactly recreate the original image. For example, the seven transformations starting in line 6000 of *Fractal Decoder* represent my attempt to encode a circle. I overlaid the original circle with seven smaller circles, one at the center and six around the central one.

The resulting decoded image is not a circle. It is a ring of six hexagons around a central hexagon. The decoded result is a close approximation to a circle because my collage was only a close approximation.

Keep in mind that this image compression technique is most useful for images which are fractal in nature. These are images that are complex with some self-similarity at any level of magnification. Ordinary geometric objects such as lines, angles, and smooth curves are better-represented by algebraic expressions or by a few points than by this fractal compression method.

It takes only four numbers (the X and Y values of its two endpoints) to define all the points on a straight line. Trying to define the image of a fern or a cloud or the bark

	FIGURE 4	: SQUARES	

of a tree in terms of straight lines would be futile. This fractal technique succinctly defines the image of a fern with only 28 numbers. The more-complex images are more suitable for this type of image compression.

You can modify *Fractal Decoder* so that it plots the points from each transformation in a different color. The value of J tells which transformation has been randomly chosen for the next point. Use J to pick the color of that point. This way you can easily see the role of each of the transformations in creating the image. For example, with a different color for each transformation, you will see that the transformation for the fern in line 7040 generates a small portion of the stem at the bottom of the image.

You will probably want to speed this program up as much as possible: compile it, remove the comments, compress it, and so forth. The automatic window scaling routine takes a fair amount of time. Once you know the XA, XB, YC, and YD values for a given image, you can put them into DATA statements along with the transformations. Just read them in and use them rather than executing the initialization routine and checking for the minimum and maximum X and Y values.

FIGURE 5: FERN

Another possibility is that you might convert this program so that it works on the C-128's 640 by 200 pixel RGB screen. Figures 1-5 were generated on a 640 by 350 pixel screen. Many images in the book referenced at the beginning of this article were produced on 1024 by 1024 (or better) graphics screens.

See what other images you can create either by starting from scratch as we did with the triangle or by tweaking the various parameters of the transformations already given. It takes some playing around to get a feeling for all of this. Use your printer screen dump routine to make printouts of your creations. I am interested in hearing your comments and in seeing your best results. \Box

GOT A GREAT PROGRAM? KEEP IT!

That's right—if you've written a top notch game, utility, or productivity program for the 64 or 128, we recommend that you keep it—by selling it to us. Because at *Ahoy!* we pay premium rates for first-time publishing rights to your program. You retain ownership, and one year after publication the full publishing rights revert to you. At that point you can resell your program anywhere you wish.

Send your program on disk, with a program printout, printed documentation, and a SASE to:

> Ahoy! Program Submissions Ion International Inc.
> 45 West 34th Street-Suite 500 New York, NY 10001

(Send Amiga programs to *Ahoy!'s AmigaUser* Program Submissions at the same address.)

128 BASIC SCROLLER

Pass the Point of No Return in Program Editing

By Shawn K. Smith

28 BASIC Scroller makes listing through a BASIC program sinfully easy.

THE HEADACHE

With the Commodore 128's powerful screen editor, entering lines of BASIC code is very straightforward, especially compared to some other editors which I will not mention here. Unfortunately, however, the machine fares rather poorly when it comes to examining a program listing which extends beyond the visible window.

You know what I'm talking about: You load one of those extremely long programs that you're working on, type LIST, and naturally, the first couple of lines scroll by too fast for examination. With panic, RUN STOP is pressed and the lines are listed again. And this tedious process of LISTing a few lines, pressing RUN STOP, examining, and LISTing a few more is continued because it happens to be the best the machine initially offers.

EXCEDRIN

Now with 128 BASIC Scroller, examining a BASIC listing is as easy as positioning the cursor on the left top or bottom edge of the screen and pressing the Cursor Up/Down key. When this is done, the utility checks the entire screen, beginning at the current cursor location, searching for a logical line that begins with a possible line number. If a number turns out to be a valid line number, the next line in the BASIC program is listed. If the Cursor Up caused the action, the next lowest number is listed, unless the line happens to already be the lowest, in which case the last line of the program is listed. Likewise, the Cursor Down causes the next highest line to be listed, cycling back to the first line if necessary.

FINAL DIAGNOSIS

Take the time to save a copy of *128 BASIC Scroller* before running it. The BASIC loader includes the necessary code to make it relocatable. Change the variable S to any other convenient starting address that you wish.

The program does contain one harmless idiosyncracy

which you should be aware of. When the Cursor Up key is pressed at the leftmost top edge of the screen, and the first possible line number turns out to be invalid, the Cursor will relocate itself on that number. Pressing the HOME key will fix things if this happens.

I'm confident that *128 BASIC Scroller* will make examining and working with your Commodore 128 more productive. \Box SEE PROGRAM LISTING ON PAGE 66

FLAG HUNT For the C-64 By John Fedor

odging your enemy's fire while trying to quickly snatch the flag and return it to base is your main objective in *Flag Hunt*. Unfortunately, it isn't quite so easy. Besides dodging the bullets (they move quite fast), you must avoid hand-to-hand combat with your opponent. If you run into either your opponent or a bullet, you lose possession of the flag and are automatically returned to base. To shoot a bullet, press the fire button and move the joystick in the direction you wish to shoot. You must release the fire button before another shot can be taken.

The flag (the flashing F) you want to get appears above your opponent's base (the flashing triangle). By use of the ladders, make your move towards the flag. You must be totally on top of the base to receive the flag. The flag will disappear when you have possession, and then you must return to your base. Getting shot or running into the ene-

my makes you lose the flag, so be careful.

Each player moves at a fast pace, but the bullets travel much faster. The winner is shown at the end of the game. Port 1 controls the green player, while Port 2 controls the red.

This game is fast-paced and great fun for two players. To enter it, you will need to use *Flankspeed* (page 63). To play, you need to type LOAD "FLAG HUNT",8,1 (return) (followed by) SYS 49152 (return). Have fun. □

"You don't have to sell me on *Ahoy!* But why should I subscribe when I can pick it up at the newsstand?"

Here Are a Few Good Reasons:

1. You SAVE 33% off the newsstand price when you subscribe for two years (16 issues) for \$31.95. That's under \$2.00 an issue! Single year subscribers do almost as well-28% off the newsstand price. You'll do even better if you subscribe to the *Ahoy*! Disk Magazine-disk and magazine packaged together-over \$30 off the yearly newsstand price!

- 2. You're certain never to miss an issue of your favorite Commodore magazine-crammed from cover to cover with C-64 and 128 news, reviews, articles, and programs! (But we forget-you know that already!)

3. You can enjoy the privileges of the *Ahoy!* Access Club, including monthly discounts from mail order advertisers and retailers around North America.

Convinced? Then fill out the postpaid card bound between pages 50 and 51 and return it today! (If someone beat you to it, use the coupon here.)

Pure-stat College Basketball

Authorities say that coaching ability makes the difference in college basketball: Can you coach a team to the final 4, or even the National Tournament? Now you can find out! From the authors of PURE-STAT BASEBALL comes PURE-STAT COLLEGE BASKETBALL.

This statistically based program contains 20 great college teams from the past and present. See all the plays animated on the screen with 5 on 5 full court action. Everything from a slam dunk to a fast break. Special features include: Man-to-Man or Zone defenses, the option to SLOW-DOWN the tempo of the game (allowing a weaker team to be competitive with a stronger one), or take a 2 point shot with current teams, fatigue fectors are included for or take a 3 point shot with current teams, fatigue factors are included for

In PURE-STAT COLLEGE BASKETBALL you can play against an opponent, play against the computer, or let the computer play itself (great for tournament play). This program also includes a stat compiler which saves the results of the games played. This feature allows you to scout the opposition or evaluate your own team. If you feel you're up to the challenge, set up your own tournament and test your coaching skills. Will your team make it to the final 4?

See your local dealer, or contact:

An optional Tournament Disk and Create Team Disk are available.

959 Main Street, Suite 204

Stratford, CT 06497

(203) 377-4339

The authors of Pure-Stat Baseball and Pure-Stat College Basketball introduce their most precise simulation to date, PURE-STAT FOOTBALL! This third generation football game has a wide array of innovative features that include: Computer Coaching using artificial intelligence to select offensive/ defensive plays, Vertical and Horizontal Scrolling of on-field action, a built-in Stat Compiler, and much more. PURE-STAT FOOTBALL will challenge even the most avid fan!

- For zero, one, or two players
- Statistically based program where Pro-Football
- players and teams perform as they did in real life Built-in Stat Compiler that includes League Standings
- Full screen graphics with 22 animated players (No X's and O's)
- Eight types of runs, 12 types of passes
- Draw Plays, Reverses, Screen Passes Blitz Linebackers, Double Team Receivers
 - Zone Defense, Prevent Defense
 - Use Four Receivers, Insert a Fifth Defensive Back
- Optional Team and Create Team Disks Available

Suggested retail price \$39.95

Finest Funware for the By Arnie Katz and

There certainly was no shortage of new Commodore 64 games in 1988, primarily due to a strong influx of titles from Great Britain and continental Europe. Many of these were runof-the-mill programs, but some of the imports are equal to the best of the creations of domestic designers.

It would have been a much duller year without the European connection. As eventually happens to all systems in the changing world of home computing, the Commodore 64 has slipped from its position on the cutting edge of American software development. Virtually all entertainment programs were developed on the Commodore 64 as recently as 1986.

Today, most games produced in the United States are developed on MS-DOS and Amiga computers. Skilled programmers then translate the original design into C-64-compatible code. Games which *are* developed on the Commodore are often aimed as much at the UK as at the US.

This has important effects on entertainment software published in this country:

· Fewer new games make their de-

Speed Buggy: enjoy the thrills and spills of off-road racing onscreen.

32 AHOY!

YEAR'S ENTERTAINMENT

of 1988 Commodore 64 the Editors of Ahoy!

e

e

d

but on the Commodore 64.

• Fewer new games maximize the power of the Commodore 64.

 Most C-64 games are designed to work on European tape-based systems.

Despite these negative factors, Commodore games are truly better than ever. Designers, illustrators, and programmers have all become more conversant with the capabilities of the system and, consequently, better utilize its power.

Ahoy! editors examined several hundred games introduced for the Commodore between September 30, 1988 and October 1, 1987. The programs described in this article constitute their choice of the best in a strong field. The judges could have added at least another 30 to 50 titles to the list of winners without sacrificing much quality.

The writers who regularly cover entertainment software for *Ahoy!* have collaborated on this effort to honor the top entertainment products of 1988. The compilers hope that readers whose favorites didn't make this year's list will be charitable about any difference of opinion. Few games are so awful that they are universally unloved, and even fewer are so perfect that they escape

Monopoly enhances the board game's appearance without changing the rules.

Superstar Ice Hockey's league play system earns a check. The net result is a chance to interact on many levels.

The postnuclear war United States of Wasteland provides an exciting backdrop for expeditions in which the player controls a party of six characters, each endowed with unique abilities.

Superstar Indoor Sports offers four off-beat events: ping pong, bowling, darts, and air hockey. Each is good enough to have been a stand-alone game.

AHOY! 33

The Three Stooges vividly evokes Moe. Larry, and Curly's slapstick comedy via charming action games derived from some of their famous scenes. It is simultaneously fun and funny.

Halls of Montezuma superbly reproduces major battles of the U.S. Marines.

Game of the Year

The choice of *Skate or Die* (Electronic Arts) as Commodore 1988 Game of the Year symbolizes a major shift in game design. The previous two winners, *Elite* (Rainbird) and *Shanghai* (Activision), were both strategy contests that challenged brain cells more than reflexes. *Skate or Die* is uncompromising arcade-style action, embellished with the best audiovisual effects found on any Commodore 64 program.

The pendulum is swinging away from cerebral software to boot and bash disks. There are three main reasons for this change:

1. The renewed popularity of video

The Games -Winter Edition features camera-eye views that give the feel of network coverage. Events include slalom, figure skating, cross-country skiing, luge, ovaltrack speed skating, and ski jump.

all criticism. Apologies are also due to publishers whose programs arrived too late for consideration this year. They will be eligible for recognition in the "Best of 1989" competition, winners of which will be announced in the January 1990 *Ahoy*!

Games designed by Subway Software (Arnie Katz, Bill Kunkel, and Joyce Worley) are automatically ineligible for consideration. No one should judge his or her own work. However, there is no law against checking out *MicroLeague WWF Wrestling* and the *Superstars of Wrestling* (all MLSA) match disks.

Each category begins with our selection for the best new game of that type, followed by a group of honorable mentions. The envelopes are stacked on the podium. Now, to the winners.

The sophisticated scenario of Pool of Radiance, based on a printed module for Advanced Dungeons & Dragons, separates it from the many other excellent games of its type published during 1988.

games clearly demonstrated to computer software makers that the public is no longer bored with action-oriented software.

2. Commodore disks compete with Nintendo and Sega cartridges for shelf space in discount stores. Hot joystick contests are a good way to lure video gamers into the computer audience.

3. The British market voraciously gobbles action games. This has created a reservoir of hundreds of titles for any American publisher that wants to put together a line of C-64 leisureware.

Sports

This year's top sports game combines elements of both action and statistical simulations. Ed Ringler's *Superstar Ice Hockey* (Mindscape) lets the computerist interact at a variety of levels. It is possible to coach from the sidelines or directly control the skaters on the ice.

A game of *Superstar Ice Hockey* is fun, but the program's system of league play delivers the maximum entertainment punch. The player must succeed as general manager, coach, and player to turn a franchise into a dynasty.

Pure-Stat Football (Software Simulations), John Elway's Quarterback (Melbourne House), and 4th and Inches (Accolade) have turned a weakness in the Commodore software library into a strength. Football fanatics haven't had many choices, but these three titles are Super Bowl quality.

Pure-Stat Football (Software Simulations), by the same group which created *Super Bowl Sunday* (Avalon Hill), is the best football statistical simulation available for any home computer. The solitaire mode is especially good, because the computerized coach adjusts to the gamer's play selection strategy during the course of the game.

The other two pigskin programs are more action-oriented. John Elway's Quarterback is a faithful home translation of a popular 1987 coin-op. 4th & Inches, by veteran designer Bob Whitehead, makes it easy for players to pick offensive and defensive formations by showing the alternatives right on the playfield screen. This permits the game to include a variety of plays without asking the human participants to memorize a lot of pass routes and blocking assignments. Epyx, which pioneered Olympicstyle sports with *Summer Games*, applies the latest programming and design techniques to 1988's *The Games*. This multievent action-strategy program is packed with cold weather athletic action amid the pageantry of the Winter Olympics.

Superstar Indoor Sports (Mindscape) comes from the same Ed Ringler-led design team as Superstar Ice Hockey. It offers four off-beat events: ping pong, bowling, darts, and air hockey. Each of these contests is good enough to stand alone, but together they make Superstar Indoor Sports and outstanding software bargain.

Action

Constantly complaining commuters have finally gotten a game which celebrates their ordeal. *Metrocross* (Epyx) is a madcap race against time in which the onscreen character leaps barriers, dodges rolling cans, and rides skateboards to get to his destination.

Blockbuster (Mindscape) adds some new wrinkles to the classic wall-bashing game in which players try to clear playfields one brick at a time. The main innovation is that the player can convert tokens, earned by destroying key bricks, into extra powers. A playfield construction module gives computerists the chance to concoct their own Blockbuster challenges.

Bubble Ghost (Accolade) rewards accuracy, not speed. The player blows puffs of air to gently guide a fragile bubble around sharp spikes, lit candles, and similar perils. The Infogrames design group, also known for the splashy *Captain Blood* on the Amiga, combines simple, well-drawn visual elements into a wide variety of engaging puzzles.

Speed Buggy (Datasoft) and 4x4 (Epyx) give computerists the chance to vicariously experience the thrills of offroad racing. Although the games depict the situation somewhat differently from each other, both are fast-paced and reasonably challenging. Speed Buggy stresses high speed driving over tortuously curving roads, while 4x4 emphasizes road hazards like rocks and fences.

Action Strategy

Strategy games built on simple, joystick-driven interfaces show no decline in popularity. They have the excitement of action games, plus the additional mental challenge once found only in the standard strategy contests.

The Three Stooges (Cinemaware) is a computerized board game with the flair players expect from Bob and Phyllis Jacob's design and development taskforce. It vividly evokes the Three Stooges' slapstick comedy through its charming action games derived from some of their most famous scenes.

The computerist directs the efforts of Larry, Moe, and Curly to raise enough money to save an orphanage from foreclosure. The only way the boys can earn money for this worthy cause is to take jobs, each represented by an action game.

The Three Stooges has lots of physical comedy, and the characters exude

The Lipstik controller included with Echelon adds a play element not found in any previous flight simulator: the capability of shouting commands at other crew members.

their familiar celluloid personalities. The Three Stooges is a rarity among entertainment software products; it's a game that is both fun and funny.

The President Is Missing (Cosmi) makes the user interface more transparent, heightening the player's involvement. The action in the game parallels what the computerist is actually doing in the real world. In *The President Is Missing*, the player must save the nation's chief executive by using the computer console to correlate information and unravel the mystery.

It's hard to keep a bad man down, and Elvin Atombanger of the original *Impossible Mission* (Epyx) is one of the worst villains in computer gaming. The sequel, *Impossible Mission 2* (Epyx), merits an honorable mention for bringing Elvin back, more formidable than ever! There's plenty of climbing and jumping action as the player tries to arrest the megalomaniac in his central tower.

BattleDroidz (Datasoft) combines the tricky maneuvering of games like 1987's Marble Madness (Electronic Arts) with the excitement of an action combat contest. The three-robot warrior team patrols over the digital landscape on a mission to conquer warzones and kill the enemy Cyberites.

Strategy

The recent success of action games doesn't mean that publishers have neglected fans of brain games. There weren't as many new strategy contests as in previous years, but the top titles compare favorably with the all-time bests.

Monopoly (Leisure Genius) is not the first attempt to put the world's most popular board game onto a computer screen, but it is surely the most satisfying. The British design team has done a marvelous job of enhancing the appearance of the real estate game without altering the traditional rules.

The two honorable mentions continue the international motif started with the winner. *Soko-Ban* and *Tetris* (both Spectrum Holobyte) were conceived on foreign shores.

Tetris is the first game conceived in the U.S.S.R. to reach the United States. The mathematical simplicity of juggling little shapes to fill each row of the rectangular playfield is entrancing. Tetris may be the most addictive strategic game since Shanghai.

The President Is Missing! makes the user interface more transparent, as the action in the game parallels what the user is doing in the real world. Clues are provided on a 30-minute audio cassette and in simulated C.I.A. data banks. The computer is used to correlate the info and solve the mystery.

The Japanese design team for Soko-Ban turns running a warehouse into a series of topological puzzles. The player transfers cartons to the holding area in the fewest possible moves. The player only has the strength to push one box at a time, so it takes a lot of careful arranging in order to get them all to the destination.

Military Strategy

The year's best war game is the product of Australia's most famous design team, Ian Trout and Roger Keating. Their *Rommel* (Strategic Studies Group) is a complete simulation of the North African campaign of World War II for experienced armchair military strategists.

It's easy to pour on the special rules and extra factors in a wargame, but it is much harder to fully simulate a situation in a playable structure. That's the genius of *Rommel*. It is as accurate and exhaustive as any non-electronic multimap war game, but is no harder to grasp than the typical introductory military simulation.

The user interface organizes the turn sequence and presents the decision points to the computerist in logical order. *Rommel* is intellectually taxing, but it is not frustrating.

The design duo from Down Under had two honorable mentions in 1987, and cops another this year for *Halls of Montezuma* (SSG). It employs a version of the same basic play-system used in *Rommel* to reproduce major battles involving the United States Marines. It has so many of the virtues of *Rommel* that the judges practically flipped a coin to see which one should head the list.

Panzer Strike (Strategic Simulations) is an advanced tactical simulation of World War II armored combat. The computerist can restage actual battles, wage an entire campaign, or construct hypothetical scenarios. Gary Grigsby's tribute to tanks is so detailed that each unit depicted on the playfield represents one armored fighting vehicle.

P

S

n

u

P

p

st

th

tra

I

Tobruk (Datasoft) shows that there is more than one way to simulate a battle. Steven R. Williams presents a joystick-activated wargame based on the most famous battle of the same WW II campaign which inspired Rommel. Unlike Trout and Keating's masterpiece, this graphics-intensive strategy contest would be a perfect introduction to wargaming. It sacrifices some detail, of course, but only to make it suitable for the casual computer gamer.

Wooden Ships & Iron Men (Avalon Hill) and High Seas (Garde Games) both simulate naval warfare during the age of Fighting Sail. The former title is based on the classic board game, while the latter capitalizes on the graphic capabilities of the computer. High Seas is especially appealing to those who don't normally have the patience for war games, because it is streamlined, playable, and pretty. Wooden Ships & Iron Men is less flashy, but investigates the subject in greater depth.

Simulators

of

d es

d

ıd

ct

The designer of the year's best simulator, Distinctive Software, is aptly named. After hundreds of "me, too" auto race games, *Test Drive* (Accolade) stands out like a new Corvette at a demolition derby. Its first-person view includes the instrument panel as well as the rugged mountain road ahead. The computerist actually sees the driver's hand move the stick from position to position when shifting gears.

Test Drive is one of the few computer racing games in which an arcade ace can't just put the pedal to the metal and zoom through the whole course at top speed. Getting to the top of The Rock in *Test Drive* really does make the player "King of the mountain."

The Lipstik controller which is packaged with *Echelon* (Access Software) adds a dimension not found in any previous flight simulator. For the first time, the armchair pilot can actually shout commands at the other crew members during the outer space battle action.

Sid Meier and Arnold Hendrick, the authors of *Red Storm Rising* (Micro-Prose), use Tom Clancy's novel of the same name as the background for a minutely detailed submarine combat simulator. The striking graphics, Micro-Prose's best ever, and slick Commodore programming by Silas (*Castle Wolfenstein*) Warner makes *Red Storm Rising* the better of the two recent attempts to transform Tom Clancy novels into computer games. (See review in this issue).

If Bruce Artwick's *Flight Simulator II* (SubLOGIC) doesn't have enough action, try the eight combat scenarios in *Stealth Mission* (SubLOGIC). Steve Setzler, under the direction of the inimitable Artwick, designed this flawlessly animated first-person simulation of modern air warfare.

Adventures

Adventures remain one of the most popular types of computer games, but the category has changed a lot since *Ahoy!* first began compiling these annual surveys of outstanding recreational software. Almost all the adventures marketed in 1986 were either prose or illustrated quests. However, neither this year's winner nor the three honorable mentions fall into either subclass.

Wasteland (Electronic Arts) proves that the interplay group can handle science fiction as well as fantasy. The post-nuclear war United States provides an exciting backdrop for expeditions in which the player controls a party of six characters, each with unique abilities.

Beautiful color graphics in first-person perspective enliven the questing in *Might & Magic* (New World Computing). Jon Van Caneghan's design builds on the conventions of fantasy role playing games with intelligence and skill.

Advanced Dungeons & Dragons: Pool of Radiance (Strategic Simulations) finally brought and authorized

Leisure Genius

What will next year's best be like? It is risky to speculate so early in the year, but publishers' announced plans provide clues.

The total number of new games will dip again, though there is no reason to expect a shortage of fresh software. Action and action-strategy games, followed closely by sports, are likely to comprise the largest portion of the output. An upswing in games tied to major licenses is also in the cards for 1989.

And with any luck at all, we'll be back at this time next year to extol the virtues of another outstanding group of games for the Commodore. \Box

Contributors to *Tips Ahoy!* will be compensated at competitive industry rates. Send your best programming and hardware hints for the C-64, C-128, or Amiga (send longer routines on disk, please) to *Tips Ahoy!*, 45 West 34th Street-Suite 500, New York, NY 10001. Include a stamped and self-addressed return envelope if you want your submission returned.

DISK ID CHECKLIST

If you have more than a few disks and do not keep a record of their ID's, you may find that you have duplicate ID's on some of them. The following short program will print a checklist of 360 number and letter-number combinations suitable for use as disk ID's. Although this does not represent all possible ID combinations, it will be enough for all but the most incorrigible packrats.

Print a copy and keep it near your computer. When you format a new disk, select an ID from the checklist and circle it so you know not to use it again.

Once a disk has been formatted, it is impossible by ordinary means to change the ID except by reformatting (and thus erasing the disk). Changing the ID in the disk header does not help. When the disk was formatted, the ID was written to the header block of every sector on the disk. These sector header blocks are never rewritten. These are the ID characters the DOS looks at when deciding whether to copy the BAM.

You can lose data if you have two disks with the same ID. For example, if after working with one disk you place another with the same ID in the drive, the DOS thinks it is the same disk and does not read the BAM. If a save is then made to the second disk, existing data may be overwritten. —Leo Brenneman Erie, PA

COLOR LIST

Here is a small routine I'm sure you will enjoy. It adds color to a listing.

How it works: When a line starts with a REM statement with at least one character, this routine changes the first character of the REM statement to ASCII for red, green, blue, or white, producing a multicolored listing.

I'm a believer in structured programming. I break my large program into small manageable subroutines. I use REM statements as headers for these routines. When I debug a program I search for the REM header for the program routine as the listing scrolls by. Finding the header can be a difficult task. This program colors the REM statements alternating colors, making the search easy.

BASIC interprets the ASCII number of most colors as key word tokens (unless they are in quotes), making them unavailable to color a listing. The exceptions: red, green, blue, and white are completely ignored. This means a colorized REM statement will revert back to the current cursor color if it is reentered. However, the color is SAVEd and LOADed with the rest of the program.

Directions to color a program:

1. Type in routine with the REM statements.

2. SAVE routine.

3. Run and list routine. The routine should list in red, green, blue, and white. If not, correct and go to step 2.

4. Load program to be colorized.

5. Place cursor next to line 62000 and press RETURN until all lines of the routine are entered.

6. RUN 62000.

Your program now lists in color.

A mistake in entering this routine has the potential to trash a program. It should first be tested on itself.

This program demonstrates all four possible colors. In my personal version of the program I use only red and green (ASCII 28 and 30). I find this combination easiest on the eyes. I changed line 62020 to

62020 LP=PEEK(43)+256*PEEK(44):C(0)=28:C (1)=30:C(2)=28:C(3)=30:K=0

For a C-128 version of the program change line 62020 to

62020 LP=PEEK(45)+256*PEEK(46):...

DISK ERROR TRAPPING

There are many types of programs that save data in a sequential or relative file on disk. In some of these programs, the program asks the user to input the name the file should have. This can cause problems. When users input the name of the file later to retrieve the data, they may not remember the name correctly, or may mistype it. They may even forget to put the disk containing the file in the drive. In any of these cases, the computer will fail to find the file on the disk.

Most computers would stop at this point and signal an error. The Commodore 64, however, tries to read the data from the nonexistent file. When it does this, the variables that are supposedly being read from the disk actually retain their original values. Usually, these values are zero for numeric variables and an empty string for string variables. The program then continues to execute, and either gives incorrect results or crashes later.

To prevent this, the program should be able to detect when the file was not found and ask the user to input the correct file name. The easiest way to do this is to have the program save a test variable when it saves the data on disk. When it retrieves the data, it can retrieve the test data first. It then checks to make sure that this data has the expected value before reading the rest of the data. The following output and input routines demonstrate the principle.

OUTPUT ROUTINE

10 INPUT "Name of file to save data in"; F\$ 20 OPEN 2,8,2,"@:"+F\$+",S,W" 30 PRINT#2,999 40 PRINT#2,X:PRINT#2,Y 50 CLOSE 2

INPUT ROUTINE

100 INPUT "Name of file to load";F\$ 110 OPEN 2,8,2,F\$+",S,R" 120 T=0:INPUT#2,T:IF T<>999 THEN CLOSE 2 :PRINT"File not found.":GOTO 100 130 INPUT#2,X:INPUT#2,Y 140 CLOSE 2

In the save routine (lines 10-50), the number 999 saved on disk in line 30 is the test data. Line 120 makes sure that this data was read correctly from the disk. (Notice that T is set to zero first, in case it was still 999 from the last time a file was read.) If T does not equal 999, the program forces the user to input the correct file name. Of course, the program could go someplace else, like the main menu, if the file was not found. —David Leithauser New Smyrna Beach, FL

EASY ADDRESS

Viewing the disk directory has always been a convenient way to obtain facts concerning the contents of a disk. Although a reasonable amount of data is featured in the directory, there are still occasions requiring even further information. For example, think of all the times you may have forgotten the starting address of a particular machine language file. Perhaps you cannot even recall if the file is BASIC or machine language. Wouldn't it be nice if you could simply load in the disk directory and see the starting addresses along with the file names?

It is necessary to point out that starting addresses are not actually stored within the directory itself. They are stored in a low byte/high byte format at the very beginning of each program file. To display these would require that each individual program file be opened, address bytes fetched, file closed, and the process continued until the end of the directory is reached. On a large directory listing this would take a considerable amount of time.

The solution to this is *Easy Address*. With this short machine language utility you can display the address of any particular file or files you desire with merely a key press.

Easy Address is a machine language program written in the form of a BASIC loader. Since the program erases itself in memory after it has run, be sure to first save a copy to disk immediately after typing the program in.

Using this utility is a snap. First you must load and run *Easy Address*. Next, find a disk that contains one or more files of which you would like to see the starting addresses. Insert the disk in the drive, load the directory, and then list it. If you are using the DOS Wedge you can accomplish the same thing by simply typing "@\$" and pressing RE-TURN. Now, just move the cursor to the line containing the file name you would like to find the address to and press CTRL/A. The disk drive will briefly start up and then the file's starting address will be displayed just to the right of the file name. You may view as many addresses as you wish by moving the cursor to the proper line and pressing CTRL/A again. You can also swap disks and load in a new directory if you desire.

Easy Address is interrupt-driven; therefore it is a good idea to disable this utility after you are through using it. This can be done by using the usual RUN STOP/RESTORE combination. It can be reenabled with SYS 828 provided that no other program has since used the RAM in the cassette buffer (828-1029).

This utility works only on "PRG" file types. Attempting to use it on other file types will not hurt anything, it just won't work! "SEQ" and "REL" files do not have starting addresses.

If you are like me you've probably amassed several disks that contain miscellaneous "type-in" programs. It would be a good idea to save a copy of *Easy Address* on each of these for your convenience in use. I'm sure you will find it a useful resource to your software library. —David Roth McAlester, OK

WHIRLPOOL C-64

In searching for ways of enhancing title screens, game screens, etc., I came up with Whirlpool. This program will make your screen turn into your kitchen sink as the water goes down the drain.

After you've typed in a copy, run it. The loader will POKE the data into memory. At the top of the screen you will see a number. This number will increment from 0 to 16666. If the last number is not 16666 there is an error, and an error message will appear. But if everything goes well, you will be prompted how to use the ML program. To start the entrancing effect, type SYS 49152 and to stop it before you get dizzy, type SYS 49155. Have fun!-Jeffrey D. Panici Sandwich, IL

ONE-TOUCH

Are you 64 users out there aggravated by having to hit the RUN STOP key along with RESTORE? Yeah? Then you'll appreciate this neat little down-and-dirty programming trick: the short BASIC program below repoints the NMI handler so that the subroutine checking for the RUN STOP key is bypassed. Next, a small ML "wedge" routine is inserted into the BASIC main loop to make sure that the NMI alterations stay intact. The result: a one-touch RE-STORE key! You'll enjoy the convenience, and your RUN STOP key can take a well-deserved rest. - Barry L. Camp Berrien Springs, MI

SCREEN LINE REVERSER

The following programs are for the 64 and 128 in 40 columns. These routines will reverse any number of characters on any screen line beginning at any column. It takes the form SYS(address), row, col, no. of characters. If the number of characters exceeds characters remaining on the line, the extra characters will be ignored. In other words, the reversal will not wrap to the next line. The routines are completely relocatable (change the variable SA).

To undo the reversal, call the routine again with the same parameters. Put the routine in a loop to flash a high score or to call attention to an error condition. Or use it to hilight a menu selection.

Unlike most C-128 screen operations, row and column

Lyco Means Total Service.

Mark "Mac" Bowser, Sales Manager

I would personally like to thank all of our past customers for helping to I would personally like to thank all of our past customers for herping to make Lyco Computer one of the largest mail order companies and a lender in the Industry. Also, I would like to extend my personal invitation to all computer enthusiasts who have not experienced the services that we pro-vide. Please call our trained sales staff at our toll-free number to inquire about our diverse product line and weekly specials.

First and foremost our philosophy is to keep abreast of the changing market so that we can provide you with not only factory-fresh merchandise but also the newest models offered by the manufacturers at the absolute best possible prices. We offer the widest selection of computer hardware, software and accessories.

Feel free to call Lyco If you want to know more about a particular item. I can't stress enough that our toll-free number is not just for orders. Many companies have a toll-free number for ordering, but if you just want to ask a question about a product, you have to make a toll call. Not at Lyco. Our trained sales staff is knowledgeable about all the products we stock and is happy to answer any questions you may have. We will do our best to make sure that the product you select will fit your application. We also have Satur-day hours — one more reason to call us for all your computer needs.

Once you've placed your order with Lyco, we don't forget about you. Our friendly, professional customer service representatives will find answers to your questions about the status of an order, warranties, product availability, or prices.

Lyco Computer stocks a multimilion dollar inventory of factory-fresh merchendiss. Chances are we have exactly what you want right in our ware-house. And that means you'll get it fast, in fact, orders are normally shipped within 24 hours. Free shipping on prepaid orders over \$50, and there is no deposit required on C.O.D. orders. Air freight or UPS Blue/led Label slipping Is available, too. And all products carry the full manufacturers' warranties.

I can't see why anyone would shop anywhere else. Selection from our huge in stock inventory, best price, service that can't be beat-we've got it all here at Lyco Computer.

SIMPLE RAM DISK

While playing with my 1750 RAM Expansion and a memory map of the C-128, I discovered a primitive way to use the 1750 as a RAM disk. It can store eight BASIC programs for immediate retrieval. The programs can be up to 180 blocks in length. They are stored in banks 0 through 7 in the 1750. The program will work with the 1700 but only with two programs (Banks 0 & 1). The program uses three Function Keys:

F4: Read from the requested Bank number

F6: Write to the requested Bank number

F8: Swap the program in memory for the one in the requested Bank Number

•10 KEY 4, "B= : BANKO: FETCH2, 4624, 4624, B:F ETCH 46080,7168,7168,B:BANK15:"+CHR\$(27) +"J[RIGHT][RIGHT]"

- ·20 KEY 6, "B= : BANKO: STASH2, 4624, 4624, B:S TASH 46080,7168,7168,B:BANK15:"+CHR\$(27) +"J[RIGHT][RIGHT]"
- ·30 KEY 8, "B= : BANKO: SWAP2, 4624, 4624, B:SW AP 46080,7168,7168,B:BANK15:"+CHR\$(27)+" J[RIGHT][RIGHT]"

-Steve Stutts Loretto, TN

COLOR SQUARES 128

This short program is quite a workhorse. It allows you to create low-resolution graphics in 128 80- or 40-column mode (although 80-column looks better). Your paint brush, represented by an asterisk, starts in the center of the screen. By using a joystick in Port 2 you move the asterisk and push the button to turn a square "on." Be careful, though; a square is erased if you go over it a second time. To change colors, press the C key and type a number 1-16, (the color codes appear on pages 247-248 in the 128 system guide). Press the E key to erase the entire screen and the H key to return to home position in the upper left corner. Also, be careful about moving the asterisk off the sides of the screen, as this causes gaps in your picture. Have fun!

anish is the ultimate projectile game, played in three dimensional perspective, in which each player literally tries to hold his ground. Designed for the Commodore 128 and

played on the 40 column graphic screen, the game requires two joysticks, one for each player.

The object of the game is to protect your grid squares from the starlike projectile. If the projectile hits a grid square, it will vanish. If you are on the vanished grid square, you fall into oblivion and the game is over. The game will also end if you only have one square left on your side if you move totally off the grid.

You have a paddle that you can move anywhere on the grid if you are on the receiving end. The other player will not be able to move his paddle at this time—only the receiver's paddle can move. The paddle is used to catch the projectile. This is one of two ways you can change from a receiver to a sender. If the projectile is controlled by the computer, it will automatically send the projectile to the other player. If the projectile is player-controlled, you use your joystick to determine the row and column you want the projectile to land on in your opponent's grid. If you select a grid square that has been hit previously, the positions of receiver and sender will be reversed.

To select which row and column you want, you must hold the joystick in one of the four horizontal-vertical positions and press the fire button. Each position represents a number from 1 to 4. The positions up, right, down, and left represent the numbers 1, 2, 3, and 4 respectively.

The options available to the players are as follows: Control selection: You choose whether to let the computer select which grid square the projectile will hit, or to let each player decide for himself/herself. The default selection is the computer.

Projectile's relative speed: This determines the relative velocity of the projectile towards your grid squares. The default choice is the speed of sound, relatively speaking. The slowest speed is highway traffic and the fastest is the speed of light.

Skill level of play: The three levels are amateur, semipro, and professional. The player's paddle will have the largest dimensions in the amateur level, and will not change size no matter where the player moves. In the semi-pro level the paddle will be slightly smaller. The professional level is only for those who have mastered the other two levels. In this level the paddle changes size according to the position you are at. The default choice is amateur level. □ SEE PROGRAM LISTING ON PAGE 64

REVOLVER

Put Action and Dazzle into Your C-128 Programs

By Earl Kanady

ou are writing a program on your 128 and you would like to add some motion to it to spice it up. The problem is that most animation programs gobble up more memory than you have available. Do you give up? Not with *Revolver* on your side!

Revolver is a BASIC loader program that writes a machine language program, *Revolve*, which uses only 95 bytes of memory. It allows you to write multicolor animation programs which can take up as little as one or two blocks of disk space. That is low cost animation!

The secret of *Revolve* is what it does to the three draw colors in multicolor mode. It automatically revolves them by moving Color 2 to Color 1, Color 3 to Color 2, and Color 1 to Color 3 each time the routine is called. The colors move from one screen location to another, creating an animation effect. The key to this animation is to draw your objects using the three colors in sequence. You can either use a color rotation of 1, 2, 3 or 3, 2, 1. The se-

hoy! DISK

Why type in the listings in this month's Ahoy! when we've done it for you? All the programs in this issue are available on the current Ahoy! Disk for \$8.95. Isn't your time worth more than that?

Use the coupon at the bottom of this page to order disks for individual months, a disk subscription, or the special anthology disks described below.

(You can also subscribe to the Ahoy! Disk Magazinedisk and magazine packaged together at a spe-

cial reduced rate. See the card bound between pages 50 and 51.)

quence you use will determine the direction of the motion. For instance, a spoked wheel drawn in the order 1, 2, 3, will have a clockwise spin when animated by *Revolve*. You can reverse the spin by reversing the order in which the colors are drawn. *Revolve* rotates the colors one place each time it is called. For continuous motion your program should contain a loop which calls *Revolve* as many times as you want the motion to continue.

Revolve can be called at two different addresses. The first address, 2816, automatically revolves the colors as already stated. The second address, 2840, does not rotate the colors but can be used to rewrite one or more of the multicolors wherever it appears on the screen. You can use this to selectively change one of the three colors or insert a new color value and move it from one multicolor to another.

There is only one real limitation you must observe with *Revolver*. You are only allowed a total of four colors, including the background color, for the entire screen at any one time. You can change the color value of Color 1, for instance, any time you wish; however, the color change will take place wherever Color 1 occurs.

To help you understand how *Revolver* works, a documentation program, *Revolver Demo*, has been included. It contains five different graphic routines which show some of the ways *Revolve* can be used. Rotating Wheels shows a way to use *Revolve* by calling SYS 2840. This routine could have been written to use the SYS 2816 call and the animation effect would have been the same. It is used here to illustrate one form used with the SYS 2840 call.

Action Frame shows how *Revolve* can be used to simulate linear motion. It uses SYS 2816 inside a loop to create motion. Energy Radiation uses the SYS 2816 call and shows another animation effect available with *Revolve*. Saucers in Space has two spinning saucers and twinkling stars. Spinning Spiral illustrates how to change the multicolors while maintaining an animation effect.

To get a working version of *Revolve*, type in *Revolver* using *Bug Repellent*, then save it to disk. Make sure you have a formatted disk in your drive when you run *Revolver*, because it will write the *Revolve* ML and automatically save it to disk. *Revolve* is your working program. *Revolve* can be called with SYS 2816 or, to use the program to change multicolors, SYS 2840. After you have *Revolve* saved to disk, type in the BASIC program, *Revolver Demo*, and save it to the same disk. *Revolver Demo* LOADs *Revolve* when it is run. The demo routines use the variable D to determine how long each position is displayed before the colors are rotated again. X is used to determine the length of time the animation will continue.

I hope that you'll have as much fun using *Revolver* as I have had programming it. \Box

SEE PROGRAM LISTINGS ON PAGE 71

CALLING ALL COMPUTER RETAILERS!

Would you like to:

- Get free national advertising?
- Increase store traffic?
- Acquire the most avid Commodore computerists in your area as steady customers?

Simply offer a 10% discount to members of the *Ahoy!* Access Club, comprised of all subscribers to *Ahoy!* and *Ahoy!'s AmigaUser* (see ad elsewhere in the magazine). We'll list your store name, address, and phone number in the *Clipper* (our monthly newsletter) and on the *Ahoy!* Access Club BBS. Then, the next time a member in your town wants to make a purchase, he'll pass your competitors by. (Unless, of course, your competitors are listed—in which case you'd *really* better be!)

If an across-the-board discount is not feasible for you, but you'd like to offer our members some other incentive to shop with you, write us. Space restrictions will prevent us from listing very many individualized offers, but if yours is significant enough to warrant the space, we'll include it.

The deadline for inclusion in the April '89 edition of the Clipper is December 30. Write or call now!

Ahoy! Access Club c/o lon International Inc. 45 West 34th Street—Suite 500 New York, NY 10001 Phone: 212-239-0855

PROGRAMMING CHALLENGES

CMMCDARE

By Dale Rupert

ach month, we'll present several challenges designed to stimulate your synapses and toggle the bits in your cerebral random access memory. We invite you to send your solutions to:

> Commodares, c/o Ahoy! P.O. Box 723 Bethel, CT 06801

We will print and discuss the cleverest, simplest, shortest, most interesting and/or most unusual solutions. Be sure to identify the *name* and *number* of the problems you are solving. Put *your* name and address on the listings as well. Show sample runs if possible. Briefly describe your solutions and tell what makes them unique or interesting, if they are. You must enclose a stamped, self-addressed envelope if you want any of your materials returned. Solutions received by the middle of the month shown on the magazine cover are most likely to be discussed, but you may send solutions and comments any time. Your original programming problems, suggestions, and ideas are equally welcome. The best ones will become *Commodares*!

PROBLEM #61-1: KEY ARRANGER

This problem was submitted by Ian Dingle (Calgary, AB). Write the shortest and quickest program that randomly rearranges the keyboard. When you hit a "Q" you might get "2". Good luck debugging this one.

PROBLEM #61-2: STRING DELETER

The user specifies a string, a character position, and a number of letters. Write a program which deletes that number of consecutive characters from the given string starting at the given character position. For example, "COM-MODARES",7,2 would result in "COMMODES". Delete to the end of the string if there are not enough characters to delete the specified amount.

PROBLEM #61-3: FIVE THREES

Try this mathematical challenge from *Fun with Figures* by J.A.H. Hunter (Dover, 1965). Two three-digit numbers are multiplied. There are only five threes and they are in the positions shown. The other digits are shown as x's.

 $\begin{array}{r} x \times 3 \\ \underline{x \times 3} \\ 3 \times x \\ x 3 \times \\ \underline{x \times 3} \\ \underline{x \times 3} \\ x \times x \times x \end{array}$

Write a program to determine and display all the digits in this multiplication.

PROBLEM #61-4: TIME CALCULATOR

Set TI\$ to the current time. Write a program which takes an amount of time from the user given in the form "HHMMSS". This amount of time is subtracted and also added to the current time as given by TI\$ and the results are displayed. For example, if the current time stored in TI\$ is 9:43:08 and the user enters "020304", the program responds "7:40:04" and "11:46:12". Use 24-hour time.

This month we will present the most interesting solutions to Commodares from the September 1988 issue of Ahoy! Wallace Leeker (Lemay, MO) mentioned his experience of deja-vu upon seeing Problem #57-1: Quickly Random suggested by Justin Smalley (Boulder, CO). Indeed that problem appeared in the July 1988 Commodares under a slightly different title as #55-2: Rapid Randomizer. You should read our discussion of the solutions to that problem in last month's Ahoy!

The problem is to start with this ordered array of numbers:

10 DIM X(100):FOR J=1 TO 100:X(J)=J:NEXT

then write a routine to rearrange the array in random order as quickly as possible. The best algorithm is to take each element of the array in turn and to swap it with a randomly chosen element. After all elements have been randomly swapped, the array is in random order. This solution from Bob Rispoli (Ridge, NY) takes 99 jiffies in FAST mode on the C-128:

- •2 REM COMMODARES PROBLEM #57-1 :
- 3 REM QUICKLY RANDOM
- •4 REM SOLUTION BY
- •5 REM BOB RISPOLI
- •10 DIMX(100):FORJ=1T0100:X(J)=J:NEXT
- ·15 TI\$="[6"0"]"
- •20 FORJ=1T0100:N=INT(RND(1)*100)+1:A=X(N
-):X(N)=X(J):X(J)=A:NEXT
- •25 PRINT TI"JIFFIES"
- 30 PRINTTAB(16)"[RVSON] DONE [RVSOFF]"
- •40 PRINT: PRINT"TO SEE THE REARRANGED ARR AY HIT ANY KEY"
- •50 GETA\$: IFA\$=""GOTO50
- •60 FORJ=1T0100:PRINTTAB(15)"X"J"="X(J):F ORD=1T0200:NEXT:NEXT

AHOY! 49

Cwww.commodore.c

GET ACCESS TO REAL BUYING POWER... WITH THE Ahoy! ACCESS CLUB!

Subscribing to Ahoy! and/or Ahoy!'s AmigaUser has always made sense—for you and for us. We get to keep more of your money when we cut out the middlemen (our distributor and your newsdealer), and we kick some of the savings back to you with a discount rate.

And now you can save even more - in fact, you can save the cost of your subscription many times over!

The Ahoy! Access Club, launched in January 1986, has been expanded to offer its members even more clout in the Commodore marketplace. And for a limited time, membership will be awarded free to subscribers!

Here are some of the ways the Ahoy! Access Club can boost your buying power:

• The Ahoy! Access Club Clipper, published 12 times a year, contains exclusive discount offers on products advertised in Ahoy! and Ahoy!'s AmigaUser. Participating vendors offer reductions of 10%, 20%, 30%, or more on selected items, free bonus merchandise, and special closeout and combo offers not advertised elsewhere – all for Club members only!

• The Ahoy! Access Club Card is your ticket to discounts at participating computer software, hardware, and book dealers, and reduced admission at Commodore and Amiga conventions and swap meets across North America. (Details are found in each issue of the *Clipper.*)

 The Ahoy! Access Club BBS (modem required) offers continuously updated information on new offers available through the Club, as well as late-breaking industry news, corrections and updates to articles in *Ahoy!* and *Ahoy!*'s *AmigaUser*, and free electronic mail facilities. Operation is 24 hours a day, 7 days a week—for Club members only!

If you are presently a subscriber to Ahoy! or Ahoy!'s AmigaUser, your membership has already been activated. You'll receive the Ahoy! Access Club Clipper bound into each issue.

If you're not a subscriber, fill out and return the postpaid card bound between pages 50 and 51 today!

Let everyone else pay list price. You don't have to...when you have Access!

LOCK IN YOUR FREE MEMBERSHIP NOW!

Ahoy! Access Club membership will be included free with your paid subscription for a limited time only.

You are guaranteed free membership for the duration of any subscription paid for prior to December 31, 1988. After that date, a small additional charge may be levied.

So why not lock in free membership for as many years as you wish by extending your subscription now?

FREE ADDITIONAL INFORMATION!

Our research shows that our readers are discriminating buyers. The majority of you are intermediate to advanced users, who seldom purchase a printer, a modem, or even a space shoot-em-up on impulse. But purchase you do – after making an intelligent choice based on all the information you have.

So why not make sure you have all the information there *is* to have—for the cost of a single stamp?

Most of the companies listed at right are eager to send you free promotional materials relating to their products or services. All you have to do is detach the Reader Service Card included here, circle the numbers that correspond to the items you're interested in, and stamp and mail the card prior to the date shown.

Manufacturers and mail order houses alike know that *Ahoy!'s* following is the most computer-literate enjoyed by any Commodore monthly. They respect that kind of sophistication. So use only the *Ahoy!* Reader Service Card to request information on products seen in *Ahoy!* And when contacting companies directly by mail or phone, be sure to tell them who sent you.

It'll help you—and us.

The publisher cannot assume responsibility for errors in the above listing. Jim Borden (Carlisle, PA) had some good suggestions for improving the speed of the program. He suggested using the statement shown in line 15 rather than introducing another variable with a statement such as TO = TI. In general, the number of variables and the order in which they are defined affects the speed of a program.

Jim also used N=RND(.)*J instead of the corresponding statement shown in line 20. This selects elements 0 through 99 rather than 1 through 100, but the calculation of N is much quicker. To align the subscripts, rewrite line 10, as Jim did, or use the suggestion from Doug Ropp (Phoenix, AZ) presented last month. Doug added this statement at the beginning of line 20: X(0)=X(100). Now the elements of the array are contained within X(0) through X(99), and Jim's formula for N works properly. The program runs in 72 jiffies in FAST mode, nearly a 30% improvement.

Here is a machine language routine for the C-64 from Steve Morrison (Port Hueneme, CA) which places random numbers in the range 1 to 100 into addresses 49408-49507. Line 40 reads them back into the X array.

COMMODARES PROBLEM #57-1 : •2 REM QUICKLY RANDOM • 3 REM •4 REM SOLUTION BY STEVE MORRISON •5 REM •10 FORJ=0T064:READ A:CS=CS+A: POKE 49152 +J.A: NEXT ·15 IF CS<>9002 THEN PRINT"DATA ERROR": S TOP •20 DIMX(100):FORJ=1T0100:X(J)=J:NEXT ·30 SYS 49152 •40 FOR J=1 TO 100:X(J)=PEEK(49407+J): NE XT .50 END ·100 DATA 169,0,168,153,0,193,200,192 ·110 DATA 100,208,248,170,138,72,160,0 ·120 DATA 32,42,192,217,0,193,240,248 ·130 DATA 200, 192, 100, 208, 246, 168, 104, 170 ·140 DATA 152,157,0,193,232,224,100,208 ·150 DATA 227,96,32,190,224,165,140,69 •160 DATA 141,69,142,69,143,201,100,144 ·170 DATA 5,233,100,76,53,192,105,1,96

This takes about 250 jiffies on the C-64, but most of the time is spent in line 40, returning the shuffled values to BASIC. You might enjoy disassembling Steve's routine to see how it works. On the C-128 you might use the POINTER function to locate X(J) in memory and modify Steve's machine language routine to place the random numbers directly into X(J).

Problem #57-2: Team Play was a very tough one suggested by Dale Goupell (Alpena, MI) and William Slupe (Boise, ID). The problem is to print out schedules for tournament play. Dale wanted a schedule for 10 teams so that each team is played once in each half-season. The season is 18 weeks long. Also, each team should play once at home and once away with every other team.

This solution was sent by Fred Ransom (Oxnard, CA) in response to *Problem #32-3: Round Robin*, and it can be used to meet the requirements of this problem:

•1 REM ===================================

• 220 NEXT K
• 23() 1 (N-1)=A ϕ
• 240 NEXT J
• 2517 GLUSE 4
As written the program prints the schedule of the first N-1

As written, the program prints the schedule of the first N-1 games for N teams. The second N-1 games are against the same teams but with "HOME" and "AWAY" swapped. You can modify the program to display those games.

The second part of this problem was to set up William's tennis doubles matches. There are 3 sets per week on 3 different courts for 12 weeks. Each set consists of 2 teams with 2 players on each team. There are no fixed teams. The goal is to have the players, partners, and opponents change to the greatest extent possible.

Richie Vance (Buchanan, TN) sent a solution with a nice printout of the matches. He randomly picked players who had not already been picked for each set. This seems like a fairly fair way to go about it, although there will certainly be some complaints about the results.

You may want to modify Richie's program to allow either screen or printer output as in Fred's program above. Congratulations also to Paul Cortez (Sepulveda, CA) and George Gaudette (Lakeland, FL) for their solutions to these challenging problems.

Now for Problem #57-3: Simple Addition suggested by Necah Buyukdura (Ankara, Turkey). Given the following DATA statement:

10 DATA 9,85,"4,356","13,765","759,215"

you were to write the shortest program to read the amounts, then calculate and print their sum. The quotation marks are used because of the commas within the last three amounts. (Several readers pointed out that the original problem described *six* items, but the listing showed only five. I'm not really sure where the sixth item went. Surprisingly, some readers also predicted that the missing amount was between 100 and 999! In fact, the third item was supposed to be 347, but it got mislaid.)

The following listing shows a representative sampling of the many solutions to this problem.

Each of the solutions fits on one line of the C-128. Some of the solutions work only on the C-128. The second and third solutions fit on one line of the C-64 if you use abbreviations. You should be able to analyze each of these to see how they work. The solutions are from Sarang Gupta (Albuquerque, NM), Keith Kushner (Brooklyn, NY), Paul Cortez (Sepulveda, CA), and Wallace Leeker (Lemay, MO). Thanks to many other readers with similar solutions.

Bob Renaud (Washington, MA) solved problems 57-1 and 57-3, but he avoided the other two problems. He said that those two are entirely too practical and useful for him to indulge in. His philosophy for the whole purpose of a home

computer (and I quote) "...is to waste valuable time and energy in pursuit of the creation and perfection of utterly meaningless frivolities that have no conceivable application in the real world." Well said, Bob. That sounds like the *Commodares* motto. Notice that having a good time as well as achieving intellectual enlightenment are not excluded from the process. That's what we're here for.

In spite of its possible practicality, we will finish up with *Problem #57-4: Screen Saver* suggested by Allistair McPhee (Melbourne, Australia). The problem is to save the C-64 high resolution screen on tape or disk. The program should use variables so the location of the screen to be saved can be easily changed.

This solution from Paul Cortez is the essence of brevity.

- •2 REM COMMODARES PROBLEM #57-4 :
- 3 REM SCREEN SAVER
- •4 REM SOLUTION BY
- •5 REM PAUL CORTEZ

- •8 F\$="SCREEN":D=8:S=8192:E=16191+1
- •9 SYS57812F\$, D:POKE780, 251:POKE251, SAND2 55:POKE252, S/256:POKE781, EAND255:POKE782 , E/256:SYS62941

The filename is stored in F\$. The starting address of memory to be saved is in S and the ending address is in E. Notice that E is actually one more than the ending address value. D is the device number (8 for disk).

Paul said that the routine at 57812 accepts the parameters for opening the file (notice that F\$ immediately follows the SYS command without a colon). The routine at 62941 writes the file to the output device from the locations pointed to by the A, X, and Y registers.

To restore the high resolution screen image from the file, use the LOAD"filename",8,1 command. Enter hi-res graphics mode (refer to the *Programmer's Reference Guide*) to see the restored image. A more general screen saver program was presented in the September 1988 issue of *Ahoy*! See *Video Snapshot* by Jim Partin in that issue for a program to save any type of graphics or text screen for the C-64 at the touch of a key.

Good luck with next month's challenges. Keep those solutions and suggestions coming. \Box

Congratulations also to these readers who sent valid solutions this month and were not already mentioned.

SCREEN POCUS REVISITED By Richard Curcio

ast month's *Screen Pocus* program by Peter Lottrup can be made compatible with sound programs. The incompatibility comes from *Pocus's* use of the SID chip's voice 3 waveform, set for noise, to generate random numbers. To prevent the noise waveform from being heard, SID's output volume is set to zero. Parts of the new DATA statements replace the steps to set up SID with NOPs. The modification uses a different source of random numbers: the low byte of timer A in CIA 1 (location 56324). Timer A is used to generate the 60Hz interrupt and the low byte register continuously counts down at a rapid rate. It is by no means random, but it decrements so rapidly that PEEKing it, even at ML speeds, gives a fairly unpredictable number. The resulting *Pocus* display is unnoticeably less random.

(The high byte of timer A decrements *too* rapidly. Unless the interval between reads is highly irregular, the values returned will always be in a descending order. This phenomenon is similar to the "aliasing" that can occur in sound sampling.)

Another source of rapidly changing 8 bit numbers is the VIC chip's raster register at 53266. At any instant, this register holds the number of the screen raster line being scanned by the CRT electron beam. This register counts up at 15KHz. To get *Pocus* to use the raster register, remove the REMs in front of the new lines 50 and 60.

To implement these changes, load the original loader into your computer and enter the new DATA statements in lines 100, 140-170, 220, and 330. Change the checksum in line 30 to 27904. Delete the old lines 50-70 and type in the new lines 40-60. The new line 40, combined with the new DATA in line 100, simplifies the relocation process. \Box

Vampire's Empire is less frantic than similar games which emphasize shooting, giving the computerist some time to plan strategy, such as the placement of mirrors.

DAVILA

PHOTO: MICHAEL R.

VAMPIRE'S EMPIRE DigiTek Commodore 64 Disk; \$29.95

The classic horror movie war between Dr. Van Helsing and Count Dracula continues in game form in Vampire's Empire. The now aged evil-fighter, shown in well-animated side perspective, must stalk the King of the Vampires into the depths of his subterranean lair.

In this action-adventure, the player guides Van Helsing through the 240 multilevel screens which comprise Dracula's domain. Moving the stick without pressing the button allows Van Helsing to walk, turn around, kick enemies, and use the numerous staircases.

The wizened hero looks great as he hurries along the horizontal corridors, but steering him up or down steps is sometimes frustrating. The computerist must precisely position Van Helsing to make him use a staircase. In an otherwise fast-moving game, stairs can cause an irritating delay.

Pressing the button while pulling the stick to 6 o'clock activates Van Helsing's equipment. The inventory is shown in a box in the lower lefthand corner of the playfield. It includes three types of objects: mirrors, garlic, and magic balls of light.

The garlic is primarily used to repel the many monsters who guard Dracula's stronghold. The mirrors are an ingenious plan to defeat Dracula by illuminating the Vampire Lord's crypt. The player must set up mirrors so that they reflect light from the surface into the gloom of the crypt.

DEVIEW

The Magic Ball makes the tricky business of aiming light a bit easier. It catches a light ray and redirects it where the player wants it to go.

When the Magic Ball is framed in the inventory window, holding the button and moving the stick up and down moves it around the playfield. Once the player captures the beam, pointing the stick and releasing the button sends it in the desired direction.

The blood-drinking monsters are easy to underrate, because they kill slowly by sapping Van Helsing's strength. They're deadly in the long run, and the game ends quickly if Van Helsing gets trapped in a dead end corridor with one of these creatures. A bottle of rich red blood on the screen slowly empties to reflect the deterioration of the hero.

Vampire's Empire is less frantic than similar games which emphasize shooting. This gives the computerist a little time to plan strategy, especially the placement of the mirrors. Vampire's Empire probably won't be anyone's favorite program, but it should please many fans of this popular genre.

RED STORM RISING MicroProse Commodore 64 Disk; \$39.95

"Red Storm Rising," the novel by Tom Clancy, is a near-future scenario

Red Storm Rising requires a much greater commitment of time and energy than most simulations. The graphics, while realistic, may be aesthetically disappointing to some.

AHOY! 55

C-www.commodore.

for World War III set aboard a state of the art U.S. nuclear submarine. This should not be confused with "The Hunt for Red October," another submarine saga by Clancy which was previously turned into a computer game by Datasoft/Intellicreations.

This tale is much more appropriate for computer simulation. Unlike "Red October," where the player's objective is to avoid confrontations, "Red Storm" has lots of combat involving super-scientific weaponry as NATO goes headto-head with the Warsaw Pact.

Red Storm Rising was given an astonishingly detailed treatment by designers Sid Meier and Arnold Hendrick. Their design is capped off with C-64 programming by Meier, Richard Orban, and the legendary Silas "Castle Wolfenstein" Warner, who clearly spent months absorbing and recreating Clancy's storyline.

Let the user beware, however. Red Storm Rising will be something of a shock for long-time MicroProse devotees. The problems first appear in an introduction to the game written by Clancy. This appears in the 100+ page instruction book:

"You are the commanding officer of an American SSN, a nuclear-powered fast-attack submarine. The word has only just arrived from National Command Authority: Your country is at war..."

"You are thirty-nine years old. A graduate of the U.S. Naval Acadmey, you've worked your way up the ladder of your chosen profession: Nuclear Power School; Prototype School; Submarine Officers Basic School; Prospective Nuclear Engineer Officer School; etc. etc. etc."

It's one thing in a role playing game to say that the player is controlling a character of a certain strength, experience, wisdom, dexterity, and durability. It's another to assume that the user can step right into the shoes of an elite submarine commander without considerably more assistance than Red Storm Rising offers.

Strangely enough, this simulation lacks ease of play and high graphics content, two elements that have been the cornerstones of previous Micro-Prose entries. Not only is Red Storm tremendously complex, but the graphics may disappoint some users (if not from a realistic viewpoint, then from an aesthetic one).

There's no doubting that the Weapons Control screen, for example, is an accurate representation of what a commander on a nuke sub would see, but the brute fact is there is very little game heat generated by watching dots move about on a grid.

The user, cast as a sub commander caught on maneuvers in the Atlantic when war breaks out, can enter the game at any of four points in the timeline: 1984 (the Russians are behind us in sub and computer technology but U.S. subs have limited weaponry), 1988 (Russian subs improved but U.S. subs have added Tomahawk missiles), 1992 (the Ruskies have a nuke aircraft carrier while we've added SeaLance missiles and Stinger masts), or 1996 (Russia has a large fleet but the U.S. has the new SeaWolf submarine). The player also selects one of five subs (though not all are available in every scenario) and opts for his choice of four difficulty levels.

The player can access a gaggle of technology, consoles, and visual displays. The three display areas are navigation, primary, and secondary. Navigation is always visible on the upper left side of the screen. The secondary display underneath the navigation screen offers five displays, while the primary display occupies the lion's share of the screen and serves eight different functions.

The primary screen includes a tactical display, acoustic conditions, sonar analysis, sonar identification, periscope video (a small onscreen window which offers the only visual contact with the target), database, weapons control, and torpedo defense.

Fortunately, MicroProse included a keyboard overlay in the package which greatly simplifies the process of selecting weapons, screens, and functions.

No one could ever say that Red Storm Rising is not a successful simulation. It is a magnificent recreation of high tech submarine warfare and a splendid translation of its source material. But fans of previous MicroProse efforts should be aware that this game requires a much greater commitment of time and energy than those earlier

betting winright), and gram's full screens are shown here and white.)

simulations.

The rewards, however, are commensurate with the effort invested.

MicroProse, 180 Lake Front Dr., Hunt Valley, MD 21030 (phone: 301-771-1151). — Bill Kunkel Circle #251 on Reader Service Card

DAILY DOUBLE HORSE RACING Artworx Commodore 64

Disk; \$19.95

W. LaCroix's *Daily Double Horse Racing*, the first full-scale computer racetrack simulation, is a marvelous recreation of the racetrack experience that can be enjoyed by either a dilettante gambler or a hardnosed handicapper. I'm a lot closer to dilettante gambler than hard-nosed handicapper, and evaluated this simulation from that perspective.

In Daily Double, a good start really is half the race. My perception, after over a hundred heats, was that the horses who broke from the gate fastest seemed to stay ahead for the rest of the race. It seems that at least occasionally a front runner should drop out of contention, or a slow starter finish fast.

But that's a small quibble about an otherwise well-designed and intelligently executed product. Much of the game's data is stored in the excellent documentation, a tabloid-style mininewspaper designed to resemble a traditional racing form. This includes complete information on the almost 200 available equines and the 12 jockeys who ride them.

Before the race begins, users visit the betting window and wager in the following categories: win, place, show, daily double (betting on two horses to win in two different races), exacta (picking the winning and placing horses in a race), quinella (picking two horses to finish first and second in a race in any order), and parlays (betting on two horses to both win, place, or show in any of the 10 races that comprise a day at the races).

To choose horses, the gamer selects an option which displays the horses running in each race. Each one is assigned a color prior to the race, to become the surrogate for one of 180 available ponies.

The bettor then scans the available information on the jockeys (number of races, finishing positions, and success based on track conditions), and considers the distance (from three to eight furlongs) and track status (turf, muddy or dry). Once this horsey wisdom is assimilated, it's time to place the bets. Finally, the program displays one of 376 prerecorded races from its memory bank. After each race, a scoreboard displays the three winners' names and how much they paid.

The graphics offer a scrolling grandstand perspective on the action. Designer/programmer LaCroix achieved a nice effect by breaking the background into three sections and moving each at a different speed. The only thing that's missing are quality audio effects. The thundering of hooves and the roar of the crowd would have added an extra dimension to the simulation. The sound effects included are very poor. The "thundering hooves" are represented by a monotonous clacking and there's no cheering at all until the race ends.

Daily Double Horse Racing could never be called state of the art software. But it's an intriguing look at the sport of kings, through a simulation that mimics many of the real-life trappings of the track.

Artworx, 1844 Penfield Rd., Penfield, NY 14526 (phone: 716-385-6120).

-Bill Kunkel Circle #252 on Reader Service Card

A QUESTION OF SCRUPLES Leisure Genius Commodore 64 Disk; \$39.95

Milton Bradley's Scruples turned moral dilemmas into a family recreation, with a personality-revealing board game. It made the ability to judge character a game-winning strategy, by challenging players to estimate their opponents' moral fiber. Now this popular pastime has reached home microprocessors, thanks to an ingenius design by Sentient Software. A Question of Scruples, published by Virgin Games through their subsidiary, Leisure Genius, and distributed in the US by Electronic Arts, computerizes these kitchen-table conflicts, to turn the board game into a high-tech entertainment for up to 10 players.

Gamers are dealt electronic hands of Dilemma cards containing moral questions, plus an Answer card which reads Yes, No, or Depends. The object is to

REVIEWS

get rid of all the Dilemma cards. This is done by querying the person most likely to give the response that matches the Answer card in the player's hand.

Successfully emptying a hand of playing cards requires judging the personality of an opponent, and guessing the reply that person will give to the question. The asker can challenge the reply, and then is offered a choice of answers from the remaining (unused) answers. The challenger selects a response; then all participants in the game vote on which answer they think correctly describes the respondent's personality. The winner in this straw poll gets to pass a Dilemma card from his or her hand to the defeated player.

The fun is in the conflict between players' visions (or pretenses) of their own character, and their image in others' (or the computer's) eyes. To establish personalities in this computer version, gamers build up bar charts with 12 individually set traits. Levels, set by moving the bar up and down with the joystick or keyboard controller, range from -8 (worst case) through 0 (about average) to +8 (highest possible). The personality traits are Principles, Personal Integrity, Professional Integrity, Trustworthiness, Family Relationship, Partner Relations, Friendships, Busy-body Factor, Humanity, Greed, Shyness, and Honesty.

After the human player enters his or her estimation of these traits, the onscreen bar chart is adjusted by the computer to conform interrelated traits. The

🕻 www.commodore.da

points to the onscreen face of the player to be asked. This person moves the hand up and down to select the answer; this elicits four choices of why they chose Yes, No, or Depends. If the response matches the Answer card in the Querant's hand, that Dilemma card is discarded, and a new Answer card is dealt for use in the next turn. Challenges can be issued whether or not the

In the screen above, the computer combs Scruples' face database for ones that suit the personalities described by bar charts like that at right.

completed bar chart is then displayed for all the players to study for a few moments.

Next the computer combs its bank of faces for five that it deems best suit the personality described by the bar chart. The player moves a highlight box up and down over the possibilities, then presses the fire button to select one. This face is displayed throughout the game, on the right of the screen with the gallery of other players.

Up to ten players can compete, or as few as three, and these can be any combination of human and computerized opponents, even all human with the computer merely acting as monitor, or all computer players with the human as a spectator.

Onscreen prompts guide the play. At the beginning of each turn, the player's face is highlighted. A pointing hand is moved over to the Answer card which reads either Yes, No, or Depends. (In multihuman games, the other player must look away from the screen while the card is displayed.)

Then the player selects the question he or she wishes to pose, from the onscreen hand of Dilemma cards, and answers match, or by the other contestants even if the asking player doesn't want to use this option. The winner of the challenge, selected by vote or all the other players, gets to give away a Dilemma card.

The player who runs out of Dilemma cards first is declared the winner. Then the computer displays all the personality charts again, but this time adjusted by the answers given during the game to reveal a truer view of each player's character.

A database of over 230 Dilemma questions and 2750 answers keeps play fresh. But that takes second seat to the personalities of the computerized players, who range from saint to sinner. There are 64 characters, varying from Clergymen to Gangsters. Better still, these intelligent computer people have mood changes from game to game, so they behave as unpredictably as humans. They also show signs of pressure when they start to lose, and exhibit increased competitiveness until they get into control of the game again.

This is a remarkable translation of a family favorite. The personality charts, which help measure the honesty of each answer, are intriguing gauges. And, the varying personalities of the built-in opponents makes it possible to play the game over and over.

The onscreen graphics are workmanlike, though unspectacular. The animated players' faces, shown on the righthand side of the screen, smile, grimace, wink, and behave like disembodied heads of playful wraiths throughout the game. Except for these faces, however, there isn't much visual enhancement.

The bar chart, too, is a good idea that doesn't quite work. Players build up these elaborate personality profiles, but they are only exhibited onscreen for three seconds at the beginning of the game. Only gamers with photographic memories can hope to gain much insight from this too brief flash of insight. The charts could have more influence on players' judgments of their opponents if they were available to view throughout the game.

Board games on computer suffer the lack of qualities that make them popular group pastimes. Play around the family table, with friends and loved ones in a social setting, always has

Platoon has many virtues and one overwhelming flaw: an awkward play mechanic that is likely to cause most users to lay down their arms. more warmth and camaraderie than any micro can produce.

But, A Question of Scruples is a worthy entrant into the field of computer entertainment. It isn't too practical for play by large groups of humans (who would have to pass the joystick back and forth to enter responses, and turn their faces away to avoid seeing other players' cards). A Question of Scruples shines best in smaller circles. It's a nice entertainment for one or two humans working against the talented computerized opposition.

Leisure Genius, c/o Electronic Arts, 1820 Gateway Drive, San Mateo, CA (phone: 415-571-7171). – Joyce Worley Circle #253 on Reader Service Card

PLATOON Data East Commodore 64 Disk; \$39.95

There's a new field of study that should be required for all game designers: ergonomics. Ergonomics is not the name of Ronald Reagan's plan to stop inflation by giving rich people more money; ergonomics is the science and study of how objects interface with the people who use them.

Are the joystick ports on your computer impossible to access? Does that pen feel uncomfortable when you write? Are your VCR controls impossible to read without a flashlight? If so, these items were probably not subjected to ergonomic testing.

Neither was Data East's *Platoon*, a multiscenario combat game with many virtues and one overwhelming flaw: it was apparently designed to be played by an octopus.

Platoon is based on Oliver Stone's sensitive and successful film treatment of an innocent recruit's nightmarish odyssey through the crucible of the Vietnam war. The film deals with the struggle between good and evil, as epitomized by a pair of sergeants. Sgt. Elias, the platoon leader, represents man's struggle to maintain the ethics of civilization in the anarchy and violence of war. The malign Sgt. Barnes is the wolf in the fold, a character who revels in combat as a cover for his villainy.

Pretty heady stuff for a Data East shoot-em-up, yet an attempt was actually made to integrate some of these stir-

REVIEWS

ring elements from the original storyline into the game's continuity.

Platoon is divided into six scenarios: The Jungle, Village, Tunnel Network, Bunker, and Jungle again. The first two are basically the same with only a change of scenery. The player leads the platoon through the mazelike Southeast Asian jungle (represented by a series of neatly trimmed pathways – so much for realism!) in search of the village. There they scavenge through the huts for useful objects, and ultimately locate a trapdoor leading to the network of underground tunnels.

In the first place, the idea of a raw recruit taking a platoon into the jungle with no idea of where they're going immediately calls the game's credibility into question. This fearless leader has no map, compass, or radio. There aren't even hints provided about where the platoon is supposed to be heading. Instead, the soldiers simply blunder about the jungle, besieged on all sides, hoping to eventually stumble on the villain.

If the player remains for more than a second in any one spot, a V.C. leaps

Circle #249 on Reader Service Card

REVIEWS

from the trees and kills him. There are also hard-to-spot trip wires which, if detonated, are lethal. Otherwise, each platoon member can survive three gunshot wounds. There are also trapdoors which open right in front of the soldier and instantly gun him down.

There are problems with the manner in which the platoon is deployed: one at a time. Every time a soldier is shot or killed, a window appears with an update on the status of each of the five platoon members. The player can select that same player, if he's still alive, or choose another.

This would be fine if the program discriminated among the five men. For example, it would be nice if they carried different weapons, moved at varying speeds and/or varied in their vulnerability to gunfire. However, these differences don't exist; the soldiers are identical. This sort of play device implies that the game is offering the player viable strategic options, but it is not. If soldiers were simply revived automatically until each collected four

Binders

sue of *Ahoy!* Our official binders turn a year's worth of *Ahoy!* into a textbook on Commodore computing! These quality-constructed binders use metal rods to hold each magazine individually, allowing easy reference to any issue without removal. Sporting a navy blue casing with a gold *Ahoy!* logo imprinted on the spine, these binders will be the pride of your computer bookshelf.

To order, send \$12.45 (US funds) for each binder desired to: *Ahoy!* Binders 45 West 34th Street – Suite 500 New York, NY 10001 (Outside Continental US add \$2.50 per binder. Allow 4 to 6 weeks for delivery.) wounds, it wouldn't make the slightest difference to the game's play.

The first two scenarios employ a three-quarters perspective with the player able to periodically move north or south to a parallel pathway.

There is a crucial problem with this game's interface. The onscreen soldiers can walk left or right, duck, jump (straight up, left or right, though the instructions neglect to mention the latter two options), shoot, and throw grenades. Unfortunately, the designers (Ocean Software) chose to initiate the grenade-throwing by having the player hit the space bar.

These mini action games are rendered all but unplayable by this need to use the space bar. The user must hold the joystick right above the keyboard to be able to hit the bar at a nanosecond's notice (which is about how long the player has between the time a trapdoor opens and its occupants open fire).

This awkward play mechanic makes a difficult game virtually impossible, and most users will lay down their arms (and the joystick) long before they ever reach the village or the tunnels.

If the player does locate and enter the tunnels, the game improves greatly. The graphics change to first person perspective, and add a crosshair. The player uses the joystick to move through the tunnels until an enemy appears. Movement ceases at this point and control is assigned to the onscreen crosshairs. While in the Tunnel, the player can locate flares and a compass (apparently the U.S. Army doesn't provide compasses, preferring troops to scrounge for them). These are needed in order to play the next mini game.

The first person viewpoint continues as the player emerges from the tunnels into a foxhole, inexplicably called The Bunker, from which he must shoot down attacking Viet Cong.

If the user survives a harrowing night in the foxhole, he then goes off in search of Sgt. Elias. Before the second Jungle game gets going, the player encounters the evil Sgt. Barnes who tells him Elias is dead. Once the game engages, however, an overhead perspective shows the player attempting to move north through a V.C. gauntlet. Sgt. Elias surprisingly appears and is killed by a burst of gunfire. "A little bit more of your innocence and sanity is eroded," the instructions explain, but if you've survived the first two scenarios, you've probably already lost any trace of sanity.

At this point, the player gets a message over the radio (where this radio comes from and why it hasn't been used before is another of *Platoon's* many imponderables). This broadcast informs him that an air strike is about to turn his present locale into an open air barbeque pit and he has only minutes to get to safety.

But first, of course, comes the showdown with Barnes in the game's ultimate scenario. The play mechanic here harkens back to the first two minigames, with all the accompanying problems.

Platoon constitutes Data East's most ambitious entry yet into the computer software market. The graphics are nice enough, and there's a lot of game value here. *Platoon* is an interesting attempt to recreate some of the sensibilities along with the thrills of the movie. Unfortunately, its success is largely sabotaged by an awkward play mechanic.

Data East, 470 Needles Dr., San Jose, CA 95112 (phone: 408-286-7074). —Bill Kunkel Circle #254 on Reader Service Card

TOWER TOPPLER U.S. Gold/Epyx Commodore 64 Disk; \$39.95

Tower Toppler challenges the player, an employee of Destructo, Inc., Intergalactic planet wreckers, to topple the eight mysterious towers that sit amidst the toxic ocean which comprises the entire planet Nebulus. The only way to bring down these towers is to climb them, and this is not easy.

The towers can only be scaled from the outside, where a network of walkways, stairs, and elevators provide access to the summit. It's not quite so easy and straightforward, however; there are obstacles and guardians along the way. There's also a preset time limit and the tower must be scaled before it expires, or the player-character does.

Some of the obstacles can be eliminated by a blast from the player's zap gun, but others are indestructible and must be avoided or circumvented, as *Continued on page 73* Attention new Ahoy! readers! You must read the following information very carefully prior to typing in programs listed in Ahoy! Certain Commodore characters, commands, and strings of characters and commands will appear in a special format. Follow the instructions and listings guide on this page.

CGRAM LISTING

n the following pages you'll find several programs that you can enter on your Commodore computer. But before doing so, read this entire page carefully.

To insure clear reproductions, *Ahoy!'s* program listings are generated on a daisy wheel printer, incapable of printing the commands and graphic characters used in Commodore programs. These are therefore represented by various codes enclosed in brackets []. For example: the SHIFT CLR/HOME command is represented onscreen by a heart

▲ The code we use in our listings is [CLEAR]. The chart below lists all such codes which you'll encounter in our listings, except for one other special case.

The other special case is the COMMODORE and SHIFT characters. On the front of most keys are two symbols. The symbol on the left is obtained by pressing that key while holding down the COMMODORE key; the symbol on the right, by pressing that key while holding down the SHIFT key. COMMODORE and SHIFT characters are represented in our listings by a lower-case "s" or "c" followed by the symbol of the key you must hit. COMMODORE J, for example, is represented by [c J], and SHIFT J by [s J]. Additionally, any character that occurs more than two times in a row will be displayed by a coded listing. For example, [3 "[LEFT]"] would be 3 CuRSoR left commands in a row, [5 "[s EP]"] would be 5 SHIFTed English Pounds, and so on. Multiple blank spaces will be noted in similar fashion: e.g., 22 spaces as [22 ""].

Sometimes you'll find a program line that's too long for the computer to accept (C-64 lines are a maximum of 80 characters, or 2 screen lines long; C-128 lines, a maximum of 160 characters, 2 or 4 screen lines in 40 or 80 columns respectively). To enter these lines, refer to the *BASIC Command Abbreviations Appendix* in your User Manual.

On the next page you'll find our *Bug Repellent* programs for the C-128 and C-64. The version for your machine will help you proofread programs after typing them. (Please note: the *Bug Repellent* line codes that follow each program line, in the whited-out area, should *not* be typed in. See instructions preceding each program.)

On the second page following you will find *Flankspeed*, our ML entry program, and instructions on its use.

Call Ahoy! at 212-239-6089 with any problems (if busy or no answer after three rings, call 212-239-0855).

BUG REPELLENT FOR THE 64 & 128 By BUCK CHILDRESS

Please note: the Bug Repellent programs listed here are for Ahoy! programs published from the May 1987 issue onward! For older programs, use the older version.

Type in, save, and run Bug Repellent. You'll be asked if you want automatic saves to take place. If so, you're prompted for the device, DISK (D) or TAPE (T). You then pick a starting file number, 0 through 99. Next, you enter a name, up to 14 characters long. At this point, Bug Repellent verifies your entries and gives you a chance to change them if you want. If no changes are needed, Bug Repellent activates itself. (Pressing RETURN without answering the prompts defaults to disk drive and begins your files with "OOBACKUP".)

Type NEW and begin entering an Ahoy! program. As you enter program lines and press RETURN, a Bug Repellent code appears at the top of your screen. If it doesn't match the code in the program listing, an error exists. Correct the line and the codes will match.

If used, automatic saves take place every 15 minutes. When the RETURN key is pressed on a program line, the screen changes color to let you know that a save will begin in about three seconds. You may cancel the save by pressing the RUN STOP key. The file number increments after each save. It resets to 00 if 99 is surpassed. After saving, or cancelling, the screen returns to its original color and the timer resets for 15 minutes.

When you've finished using Bug Repellent, deactivate it by typing SYS 49152 [RETURN] for the Commodore 64 or SYS 4864 [RE-TURN] for the Commodore 128.

FLANKSPEED FOR THE C-64 By GORDON F. WHEAT

Flankspeed will allow you to enter machine language Ahoy! programs without any mistakes. Once you have typed the program in, save it for future use. While entering an ML program with Flankspeed there is no need to enter spaces or hit the carriage return. This is all done automatically. If you make an error in a line a bell will ring and you will be asked to enter it again. To LOAD in a program Saved with Flankspeed use LOAD "name",1,1 for tape, or LOAD "name",8,1 for disk. The function keys may be used after the starting and ending addresses have been entered.

f1-SAVEs what you have entered so far.

f3-LOADs in a program worked on previously.

f5-To continue on a line you stopped on after LOADing in the previous saved work.

f7-Scans through the program to locate a particular line, or to find out where you stopped the last time you entered the program. It temporarily freezes the output as well.

Continued from page 60

with the guardians. Death, when it comes, is by pollution, after falling into water which is apparently even more foul than Boston Harbor.

The towers rotate so that the player is always in the center of the screen. On each level, a passageway shortcuts the player-character to the other side of the tower. If the player makes contact with one of the tower guardians or obstacles, he is bumped back a varying number of levels.

Conquering each of the eight towers wins the player a trip on the MK.7 sub that brought him, and a bonus game. In this horizontally scrolling contest, the player uses a mounted stun gun to daze as many fish as possible, then collects his catch by passing over them before reaching the base of the next tower.

Tower Toppler treats action puzzles in a genuinely cute, and more-or-less original manner. It's just too bad that it is marred by a malady common to much modern software design: the dreaded one-function-too-many syndrome. Games afflicted with this disease would play just fine on an IBM or one of the new videogame systems with two action buttons. The single button configuration, however, can cause even a good design to fail.

In this case, the player-character can be walked left or right with the joystick controller, and the up/down commands make him enter the passageways (up) or use the elevators (up/down).

That left two functions, shooting and jumping, and one command, the joystick button. Designer John M. Phillips solved this problem by changing the function of the button depending on what the onscreen hero is doing. If the player-character is moving, pressing the button will elicit a jump, whereas if he is standing still it will fire his weapon.

In a game as frenetic as this, where jumping and shooting often follow each other in rapid fashion, this is unsatisfactory. Tower Toppler is plenty tough on its own, with its slippery steps and roving obstacles. This kind of complicated control scheme needlessly handicaps users. Even after extensive play, users will still see their surrogate jump when they call for a shot and vice versa. Why the heck didn't the designers use the upper right joystick position for a jump to the right and an upper left command for a jump to the left (a mechanic used successfully by dozens of games)?

A seemingly small annoyance like this, when added to the game's builtin legitimate handicaps, may be enough to send many users over the frustration brink.

Otherwise, the game is quite impressive. The vertically scrolling graphics on the tower games are very appealing, with cartoonlike charm that contrasts nicely with more horrific elements like the gigantic, bouncing eyeballs that guard the Tower of Eyes.

The graphics on the bonus game are a mixed success. The ocean background is really hot, a fascinating blend of shimmering colors that suggests some of the terrifying beauty of a poisoned ocean. The fish are rendered less successfully, without any depth. But the real problem here is the lack of any sound effect or graphic to confirm that a fish has in fact been captured.

Tower Toppler is a near-miss that could have been a cult classic.

Epyx, 600 Galveston Dr., Redwood City, CA 94063 (phone: 415-366-0606). -Bill Kunkel

Problems entering a program?

The *Ahoy!* technical department is ready, willing and (usually) able to help. Call 212-239-6089 (if busy or no answer after three rings, call 212-239-0855) between the hours of 8:30 and 4:30 EST.

We welcome letters on any aspect of Commodore computing, or anything else under the sun. Write to Flotsam, c/o Ahoy!, Ion International Inc., 45 West 34th Street-Suite 500, New York, NY 10001.

ELOTS

Could any of your sources assist me with an interface problem? I am attempting to use the C-64 version of *News*room with an Epson Homewriter 10 printer. *Newsroom's* documentation does not list the Homewriter 10. I have used the logical drivers: 801, 803, etc. I phoned Epson, the manufacturer of *Newsroom*, and the store that sold me the printer. No luck. Help! –John Elliott Truro, NS

If any of our readers can help Mr. Elliott, please write to him care of us. We'll forward your letter to him, and print your explanation here to aid other readers who may be experiencing a similar problem.

I'll admit it. I find your magazine very impressive, although a year or so ago I was skeptical when you boldly proclaimed yourselves #1 in Commodore coverage.

For the past five years, I have been an exclusive user of Commodore home computers. I have considered all the others and found that they all fall short in one major area – PRICE—as I am often financially in a crunch. I find myself at a loss to see how the other companies can justify their exorbitant prices for a product that does little more (sometimes) than a Commodore 64.

In 1983 I bought my first computer—the VIC 20—and enjoyed it for at least a year before I upgraded to the 64. Then about a year or so later I again upgraded to the 128. I have since purchased a 128D and am thoroughly satisfied, despite the rumors of the 128D having a few bugs.

I look forward each month to your latest issue and being able to type in the programs, a practice I never tire of. Your magazine is top quality as to content and accuracy, while the others are full of "Mickey Mouse" programs, errors, and *just plain garbage*. Oh, they have the occasional "good stuff," but one gets tired of waiting for it. *Ahoy!*, however, has all the "right stuff" and then some each month. Keep up the good work! – John Hibbs London, ONT

Let me commend you on a remarkable magazine! My oldest son has issues dating back to early 1985, which he has given to his little brother Ted along with his C-64 and 1541. Ted is now driving me nuts each month to pick up the current copy of *Ahoy!* from the Stars and Stripes here on base.

Ted and his friends input the games each month, then try to modify them – sometimes screwing them all up. Ted seems to have the advantage, and he's getting better all the time. He goes through all the back issues, reading the step by step explanations.

I guess the old C-64 will get at least another 4+ years on it. I know your magazine alone took my oldest son from "fear" to "cheer" using a computer. Hats off to you all!

Land Combat

NEW RELEASE

WORLD CLASS LEADER BOARD Pro Golf Simulator

Now you have the opportunity to play the same courses that have challenged golf's greatest legends. "WORLD CLASS" LEADER BOARD features three famous 18-hole golf courses and each hole authentically reproduces the distance, traps, trees, rough and water hazards of:

St. Andrews - "The Most Revered Course in Golf" Doral Country Club - "The Florida Blue Monster" Cypress Creek - "The Largest and the Finest"

The Fourth course, designed specifically for "WORLD CLASS" is the "GAUNTLET COUNTRY CLUB". Only those who have mastered the best courses in the world should expect to come close to par at "THE GAUNTLET".

"WORLD CLASS" will challenge you with the same strategy and option decisions you face in your real game. And because the look and feel are so life-like, it may improve your actual golf game as well!

C-64/128, AMIGA, IBM PC, APPLE II SERIES, MACINTOSH

HEAVY METAL Modern Land Combat

Do you have the courage, skill and intelligence to move up the ranks in today's modern army? Here's your chance to find out. Find yourself in a full simulation of an M1 A1 Abrams tank, the U.S. Army's most sophisticated and powerful main battle tank.

U.S. Army's most sopnisticated and powerrul main durite taink. Or how about behind the wheel of an XN 311 FAV (fast attack vehicle) going over 100 mph attacking enemy supply depots. Trying to defend your supply stations is going to be less difficult using an ADAT (air defense anti-tank) system, but it will never be easy. You'll face a challenge you never expected to get in 0TS (Officer's Training School). Add to this the fact that battles are going on at three different fronts at once and you'll soon find out what you're made of. Do you nave what it takes? TAKE THE HEAVY METAL CHALLENGE TO FIND OUT!

C-64/128, AMIGA, IBM PC

If you can't find our products at your local dealer, you can order direct. For mail orders, enclose check or money order, plus \$1.00 shipping and handling, and specify machine version desired. Order by phone on VISA, MasterCard or C.O.D. by calling TOLL FREE (800) 824-2549. ACCESS SOFTWARE, INC., 545 W. 550 S., Suite 130, Bountiful, UT 84010.

ECHELON Space Flight Simulator

CHELON

As a top ISF pilot you are given command of a C-104 Tomahawk and are stationed in Patrol Zone 106. Yours is the only patrol craft in this zone and you must fly daily reconnaissance missions and search for artifacts and clues that may reveal the location of the Space Pirate Stronghold.

ECHELON is a true simulator that puts you at the controls of the C-104 and in the heart of the action. The craft can be operated inside the patrol zone under 3 different classifications. These include:

Scientific - This level is for those who wish to fly, explore and gather information without being attacked.
Patrol - Encounter enemy spacecraft while exploring the

unknown

(3) Military - Non-stop action facing hostile enemy spacecraft. C-64/128, APPLE II SERIES, IBM PC
